

Psychotria apdavisianna sp. nov. (Rubiaceae), a remarkable calciphile from the southern karst of Papua New Guinea

WAYNE TAKEUCHI

Harvard University Herbaria, 22 Divinity Avenue, Cambridge, MA 02138, USA; email: wtnewguinea@hotmail.com

Abstract

Psychotria apdavisianna is described from remote environments in Papua New Guinea's Southern Escarpment. The calciphilous species is the latest addition to an expanding conspectus of discoveries from the limestone biome.

Key words: limestone environments, Southern Escarpment, Strickland basin

Introduction

With an estimated 120 plus species in Papuasia, *Psychotria* Linnaeus (1759: 929) is the principal component in a rubiaceous flora noted for its diversity and endemism (Davis *et al.* 2009). Whenever previously unknown environments are opened to investigation, modern expeditions have consistently added new species to the genus.

As the largest remaining tract of uninhabited forest in Papua New Guinea (PNG) the Southern Escarpment (*sensu* Sekhwan & Miller 1994) is arguably the most prospective venue for taxonomic discovery on the mainland. In the following description of *Psychotria apdavisianna*, an unusual limestone endemic is presented from karst habitats in this region.

Methods

Taxonomic descriptions are based on the metrical and qualitative attributes from dried specimens. Characters determined *in situ* from living plants are reported separately as 'field characters'. Alcohol-preserved fruits have been deposited with the isotype at LAE.

Description

***Psychotria apdavisianna* W.N.Takeuchi, sp. nov. (Figs. 1–3)**

Affinis Psychotriae reflexapedunculatae Sohmer sed stipulis majoribus usque ad 18–31 mm longis (nec 5 mm longis) infructescientiis capitatis (nec ramosis) differt.

Type:—PAPUA NEW GUINEA. Western Province: Strickland drainage, Juha South, survey track 1 to sinkhole area, mossy montane forest, 5°53.994'S, 142°26.234'E, 910 m, 21 February 2008, Takeuchi, Gambia & Jisaka 23261 (holotype A!; isotypes K!, LAE!).

Subshrubs to 0.6 m tall, monoaxial (rarely once-branched). Stems compressed, planate or angulate, 2–4.5 mm wide, pithy; surfaces longitudinally wrinkled, furrowed or not, nigrescent to brunnescence, dull, without lenticels, abscission scars absent; indument velutinous, reddish brown, subpersisting; internodes 2–7.5 cm

Acknowledgments

The botanical survey of the Juha limestone was part of the foundation studies for the PNG LNG Pipeline, a worldclass hydrocarbon initiative under joint development by Exxon Mobil and Oil Search. My participation on the Pipeline assessment was also supported by the National Science Foundation (grant DEB 0315930), the Arnold Arboretum, and the Harvard University Herbaria. I thank reviewers A.P. Davis and H.-J. Esser for their assistance with the manuscript.
