Abstract

A new genus *Annea* is described to accommodate two tropical African legume species previously misplaced in *Hymenostegia* (Leguminosae, Caesalpinoideae, Detarieae). *Annea* gen. nov. is widespread in tropical Africa but has an unusual disjunct generic distribution, occurring in both upper and lower Guinea but absent from Gabon. *Annea afzelii* accounts for the generic range in Upper Guinea extending as far east as Equatorial Guinea in the Lower-Guinea region whereas *A. laxiflora* occupies the southern part of Lower Guinea and shows a preference for drier habitats than the more wide ranging *A. afzelii*. *Hymenostegia dinklagei*, a synonym of *A. afzelii* is neotypified. Neither species of *Annea* qualifies for a category of threat and both are assessed here as Least Concern (LC) according to IUCN criteria. *Scorodophloeus*, another exclusively tropical African genus is sister to *Annea*. Two tables of characters are included, one comparing the morphologies of *Annea*, *Scorodophloeus* and *Hymenostegia* sensu stricto and another providing morphological characters that can be used to separate the two species of *Annea*. A distribution map of *Annea*, an illustration of *A. afzelii* and photographs of *A. laxiflora* are presented.

Key words: Amherstieae, Conservation, Fabaceae, Taxonomy, Neotype, Tropical Africa

Introduction

Leguminosae is the most species rich flowering plant family in tropical Africa (Lebrun & Stork 1998) and is currently recognised as three subfamilies, Caesalpinoideae, Mimosoideae and Papilioideae. Many species of subfamily Caesalpinoideae are ecological dominants of African forest and woodland (White 1983). Together, caesalpinioid legumes number c. 2900 species in 171 genera and are traditionally arranged in four tribes. The largest tribe, Detarieae, contains 82 accepted genera as enumerated by Mackinder (2005) but with the addition of *Isomacrolobium* by Breteler (2010) and the removal of *Pellegriniodendron* which was synonymised with the genus *Gilbertiodendron* by Estrella *et al.* (2012).

At least two detarioid genera, *Hymenostegia* sensu lato and *Cynometra* sensu lato are not natural groups as currently defined (Bruneau *et al.* 2000, 2001, 2008; Mackinder *et al.* 2010). *Hymenostegia* sensu lato is an exclusively African genus, principally of trees of lowland forest, currently comprising 18 species. Of those 18, only ten may be congeneric with the type (Mackinder *et al.* 2010; Wieringa and Mackinder 2012, Mackinder and Wieringa 2013; Wieringa *et al.* 2013). Species presently assigned to the genus in its broad circumscription are morphologically diverse in several respects but all have paripinnate leaves and bear persistent paired petaloid bracteoles which are usually large and showy.

This paper is a further step towards improving the classification of the species diversity currently contained within *Hymenostegia sensu lato* (Mackinder *et al.* 2010). Based on morphological and molecular evidence, we describe the genus *Annea* Mackinder & Wieringa to accommodate two species *H. afzelii* (Oliver 1871: 318) Harms in Engler & Prantl (1897: 193) and *H. laxiflora* (Bentham 1865: 318) Harms in Engler & Prantl (1897: 193) which we transfer here as *A. afzelii* (Oliv.) Mackinder & Wieringa and *A. laxiflora* (Benth.) Mackinder & Wieringa respectively.

Justification for the recognition of *Annea* as a distinct taxon

Evidence from Morphology

In a study of vegetative morphological characters of *Hymenostegia sensu lato* and putative allies, Mackinder *et al.* (2010) predicted that of the 15 species treated by Léonard (1951), only seven belonged in the genus. Those seven species, the type species *H. floribunda* and six others, were congeneric (*Hymenostegia sensu stricto*) based on a shared unique combination of character states: (i) stipules conspicuous, the upper part narrowly oblong or linear; (ii) stipules free; (iii) stipule base auriculate; (iv) leaves with channelled rachises and (v) abaxial leaf surface appressed puberulous. *Hymenostegia (Annea) afzelii* and *Hymenostegia (Annea) laxiflora* were excluded from core *Hymenostegia* because they shared only two or three of the seven character states respectively with *Hymenostegia sensu stricto*. Based on their very similar morphologies were predicted to be sister species (Mackinder *et al.* 2010).

When Léonard (1951) published the only taxonomic account of *Hymenostegia sensu lato* to treat the genus across its full geographic range, he distinguished *Annea afzelii* and *A. laxiflora* from the other 13 species known then, as having “leaves 1–2-jugate, in the latter case the lower pair much smaller than the upper pair”. In *Annea*, 2-jugate leaves are considerably more common than 1-jugate leaves. The disparity in size of the upper and lower leaflet pairs, along with the often distinctly rhombate shape of the upper leaflet pair routinely allows collectors to recognise *Annea* species in the field even when sterile. Whilst we have not discovered any unique floral characters that distinguish *Annea* from other African detarioid genera, *Annea* can be separated using the unique combination of persistent petaloid bracteoles whose adaxial surfaces touch when enclosing the bud prior to anthesis, and an ovary stipe that is fused to the side wall of the hypanthium.

Evidence from chloroplast sequence data

During the last decade, phylogenetic studies of caesalpinioid legumes based on chloroplast nucleotide sequence data (Bruneau *et al.*, 2000, 2001, 2008; Mackinder *et al.* 2010) sampled eight, eight, five and eleven species of *Hymenostegia sensu lato* respectively and in each case resolved *Hymenostegia sensu stricto* species as a monophyletic group but *Hymenostegia sensu lato* as polyphyletic. *Annea afzelii* (as *Hymenostegia afzelii*) was one of five *Hymenostegia* species included in all four studies and was consistently placed outside the *Hymenostegia sensu stricto* clade. However, no suitable material of *Annea laxiflora* was available for those studies because (until very recently) *A. laxiflora* had not been collected since 1974 (Dechamps, Murta & M. da Silva 1586 & 1587, Angola, Cuanza Sul, à 35km de Gabela vers Novo Redondo (BR, WAG)). Consequently, the cited studies were not able to test the morphological hypothesis of Mackinder *et al.* (2010) that *A. laxiflora* and *A. afzelii* are sister species.

In October 2010, a collection of *A. laxiflora* was made in the Mayombe Hills of Congo Brazzaville (M'Boungou 398) from which nucleotide sequence data were generated. Phylogenetic analysis recovered *Annea laxiflora* as the sister species of *A. afzelii* (Mackinder *et al.* 2013) and the *Annea* species pair was resolved in turn as sister to a clade comprising all three species of the genus *Scorodophloeus*. All the relationships were robustly supported. The *Scorodophloeus-Annea* generic pair was placed in a phylogenetically distant position from *Hymenostegia sensu stricto*, in the *Scorodophloeus* clade (Mackinder *et al.* 2013) with *Micklethwaitia* Lewis & Schrire (2004: 166) and *Gabonius* Wieringa & Mackinder (Wieringa *et al.* 2013). A close phylogenetic relationship between *Scorodophloeus* (represented by *S. zenkeri*) and *Annea* (as *Hymenostegia afzelii*) was first indicated by Bruneau *et al.* (2000).

Choice of taxonomic rank

As *Scorodophloeus* and *Annea* together form a monophyletic group (Mackinder *et al.* 2013), it would be plausible from an evolutionary standpoint to transfer *Annea* species to *Scorodophloeus* to produce a single genus of five species. However, *Scorodophloeus* is a homogenous genus and the three species, *S. zenkeri*, *S. fischeri* and *S. torrei* can readily be distinguished from *Annea* species by several morphological characters. Furthermore, placing these five species in a single genus would produce a taxon for which a workable morphological delimitation would be very difficult to devise. Apparently, no apomorphic morphological characters are associated with the lineage from which *Scorodophloeus* and *Annea* arose, which may explain why this sister relationship had not been recognized prior to molecular studies. A comparison of morphological characters that can be used to distinguish *Annea* both from *Scorodophloeus* and *Hymenostegia sensu stricto* is presented (Table 1).

TABLE 1. Comparative morphologies of *Hymenostegia sensu stricto*, *Annea* and *Scorodophloeus*.

Genus Character	<i>Annea gen. nov.</i>	<i>Scorodophloeus</i>	<i>Hymenostegia sensu stricto</i>
Stipules conspicuous or inconspicuous	inconspicuous	conspicuous in young foliage, then falling	conspicuous in young foliage, persistent in some species
Stipules free or fused at base	fused	free	free
Stipule base auriculate or not	not auriculate	not auriculate	auriculate
Number of leaflets	2–4	3–20	8–50
Petal colour	pale to lemon yellow	white (but not recorded in <i>S. torrei</i>)	commonly white to yellow, rarely green
Leaflets opposite or alternate	opposite	alternate	opposite
Bracteole shape ^a	broad	narrow	narrow to broad
Bracteole enclosing the bud before anthesis	enclosing	not enclosing	enclosing
Presence of imbricate bud scales	absent	absent	present
Bracteole persistence	persisting after anthesis	fallen before anthesis	persisting after anthesis

a. We consider bracteoles to be broad if their length does not exceed 1.5 x the width and narrow if their length is > 3x width

Taxonomic Treatment

Annea Mackinder & Wieringa *gen. nov.*

Shrubs or trees to 25 m. Leaves paripinnate, 1–2-jugate, when 2-jugate the distal pair conspicuously larger than the proximal pair, leaf rachis winged or not. Bud scales absent. Leaflets sessile, ovate to rhombate, falcate, glabrous above, glabrous or almost so below, mid-vein sub-central. Crater-like glands usually present on the abaxial leaflet surface. Inflorescence a lax terminal or axillary raceme. Bracts caducous or persisting just until anthesis, bracteoles paired, showy, persistent, borne in the upper third or at the apex of the pedicel. Sepals 4, reflexed after anthesis, slightly longer than the hypanthium. Petals 5, adaxial and lateral petals conspicuous, similar in size, abaxials rudimentary. Stamens 10, filaments free, anthers dorsifixed, dehiscing by slits. Ovary stipitate, stipe fused to adaxial hypanthium wall, indumentum sparse on the faces, denser on the margins, stigma terminal, small, peltate. Pod compressed, glabrous, obliquely triangular, obovate to semi-circular, broadest at the middle or towards the apex the upper margin curving to almost straight, not winged, the lower margin deeply rounded, sometimes curving sharply upwards to the apex, valves revolute after dehiscence (explosive dehiscence). Seeds 1–2, ovoid or ellipsoid, compressed. Seedlings: germination epigeal, first and subsequent seedling leaves alternate.

Type: *Cynometra laxiflora*. For type specimen details see below.

Distribution:—Tropical Africa. Guineo-Congolian distribution: 2 species. Liberia, Côte D'Ivoire, Ghana, Togo, Benin, Nigeria, Cameroon, Equatorial Guinea, Congo, Democratic Republic of Congo, Angola (including Cabinda) (**Fig. 1**). The combined geographic distribution of the two species is wide but their ranges do not overlap.

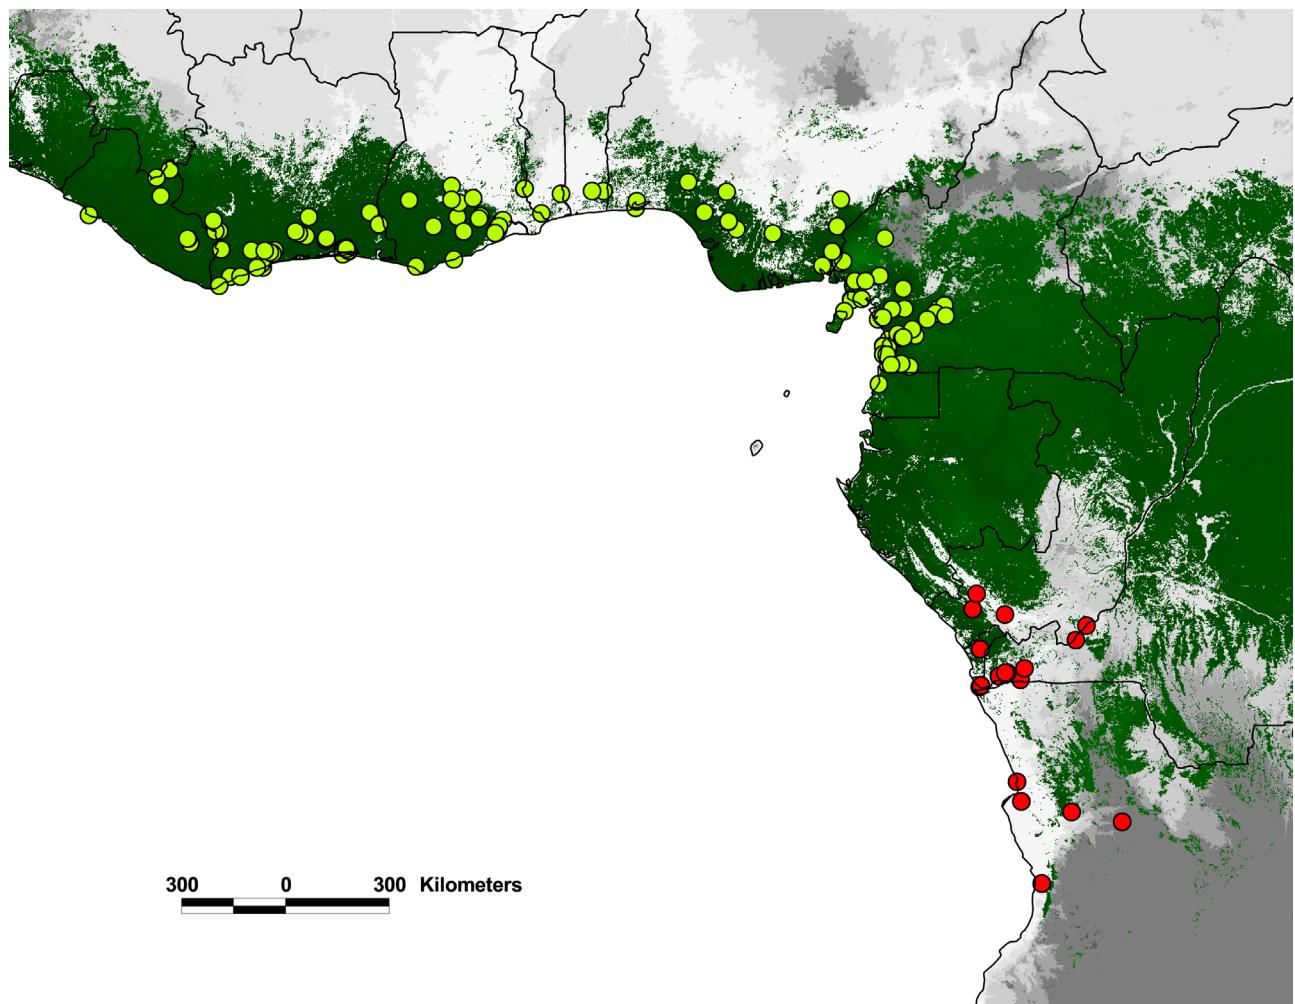

FIGURE 1. Distribution of the genus *Annea*. Collecting localities of *A. afzelii* and *A. laxiflora* are denoted by green and red dots respectively.

Etymology:—Named for Professor Anne Bruneau of University of Montreal, Canada. She has been the leading authority in Caesalpinoideae phylogenetics for over a decade. Her work and that of her students has led to the establishment of a phylogenetic framework for the subfamily creating a firm foundation on which studies of smaller taxonomic breadth such as this can rest. Bruneau made several collections of *Annea afzelii* during fieldwork in Cameroon in 1996, one of which was used in the preparation of the illustration of *A. afzelii* presented in this paper.

Key to the species of *Annea*

- | | |
|-----------------------------|------------------------|
| Leaf-rachis winged..... | 1. <i>A. afzelii</i> |
| Leaf-rachis not winged..... | 2. <i>A. laxiflora</i> |

A table of other morphological characters that can be used to separate *A. afzelii* and *A. laxiflora* is presented (Table 2).

TABLE 2. Comparative morphologies of *Annea afzelii* and *A. laxiflora*.

Species Character	<i>A. afzelii</i>	<i>A. laxiflora</i>
Length of distal leaflets compared to proximal leaflets	2 to 4 times longer	3 to 10 times longer
Inflorescence rachis indumentum	moderately puberulous	glabrous or sparsely puberulous
Bract persistence	caducous	persistent until anthesis
Pedicel length (mm)	1.5–7	7–18
Pedicel indumentum	hairy	glabrous
Bracteole position	at apex of pedicel	1.5–4 mm below the apex of the pedicel

1. *Annea afzelii* (Oliv.) Mackinder & Wieringa comb. nov. (Fig. 2)

Basionym:—*Cynometra afzelii* Oliver (1871: 318). *Hymenostegia afzelii* (Oliver) Harms in Engler & Prantl (1897: 193).

Type:—Sierra Leone. *Afzelius* s.n. (not seen).

Hymenostegia dinklagei Harms (1901: 78). Bot. Jahrb., 3: 78 (1901). Type:—Cameroon. Mundung des Campo, *Dinklage* 1437 (B†). Neotype here designated, Cameroon, S. Province, 14 km on the road from Kribi to Ebolowa, 20 June 1975, J.J.F.E. de Wilde 8298 (neotype WAG!, isoneotypes BR, EA, K!, MA, MO, P, PRE, SRGH, YA).

Shrub or tree 3–25 (–35) m tall, dbh 10 cm (5 m tree)–40 cm (12 m tree, and also at 2 m above buttresses of a 35 m tree); bark grey, orange-brown or brown, smooth, buttresses present (J.J.F.E de Wilde 8298 and Polhill 5218). Twigs medium to dark brown, moderately puberulous when young, hairs hooked (only visible at $\times 100$ or greater magnification), becoming glabrous with age, lenticels pale. Stipules in pairs, inconspicuous, fused at base, persistent, triangular, 1–1.5 mm long, apex acute. Leaves paripinnate, 2-jugate, occasionally a few 1-jugate leaves occur on the same plant (but see notes), small stalked gland occasionally present between the terminal pair, petiole 1–6 mm long, mostly pulvinous, rachis 6–22 mm long, narrowly winged from the base, becoming gradually broader distally but narrowing again just before the insertion of the distal leaflet pair, adaxially canaliculate, abaxially unevenly striate, moderately puberulous, hairs hooked (only visible at $\times 100$ or greater magnification), leaflets sessile, ovate to rhombate, falcate, upper pair 2.2–14 \times 0.9–6.4 cm, much larger than lower pair, the upper pair 2 to 4 times longer than the lower pair, glabrous or almost so, margins often ciliate at the base, mid-vein sub-central, the proximal half of the leaflet slightly larger, crater-like glands (visible at $\times 10$ or greater magnification) present on the abaxial leaflet surface, 1–4 in the proximal half, 4–7 in the distal half, apex acute or acuminate, base asymmetric. Bud scales absent. Inflorescence a lax 4–31-flowered terminal or axillary raceme, axis 1.5–8 cm long, including a peduncle of 0.4–0.8 cm long, moderately puberulous, hairs hooked (only visible at $\times 100$ or greater magnification), bracts caducous, not seen, pedicels 1.5–7 mm long (at anthesis), moderately puberulous, hairs hooked (only visible at $\times 100$ or greater magnification), reddish light green (*fide van der Burgt* 632), bracteoles opposite, persistent, borne at the apex of the pedicel, directly below the hypanthium, petaloid, obovate to broadly ovate, 7–10 \times 4–6 mm, white or white tinged pink, glabrous, base cordate; hypanthium 2.5–4 mm long, glabrous outside and inside. Sepals 4, white, pinkish at base, reflexed after anthesis, slightly longer than the hypanthium, ciliate at apex, otherwise glabrous. Petals 5, narrowly spatulate, glabrous, yellow, pale yellow, greenish yellow or lime-white when first in flower, turning pink or red later, adaxial and lateral petals similar in size, 8–11 \times 1.5–3 mm, abaxial petals smaller, c. 3.5 \times 1 mm. Stamens 10, filaments free, white, anthers dark yellow to brown. Ovary stipitate, reddish brown or brown, compressed, hairs c. 0.5 mm long, white, crinkled, occurring sparsely on faces but more densely so along margins, the marginal hairs persisting into young fruit, style and stigma white, stigma terminal, minute. Pod compressed, glabrous, 5.4–8.5 \times 2.2–3.2 cm, triangular, broadest towards apex, lower margin rounded, upper suture not broadened into wings, beak 2–4 mm long, valves revolute after dehiscence. Seeds 1(–2), ellipsoid, c. 2 \times 1.5 \times 0.4 cm thick. Seedling: leaves alternate from the outset, stipules paired, rhomboid, c. 3.5 \times 1.5 mm, leaflets sessile, 2-jugate, upper and lower pairs of first leaf similar in size, 12–16 \times 6–7 mm. Seed and seedlings measurements from Breteler 13738.

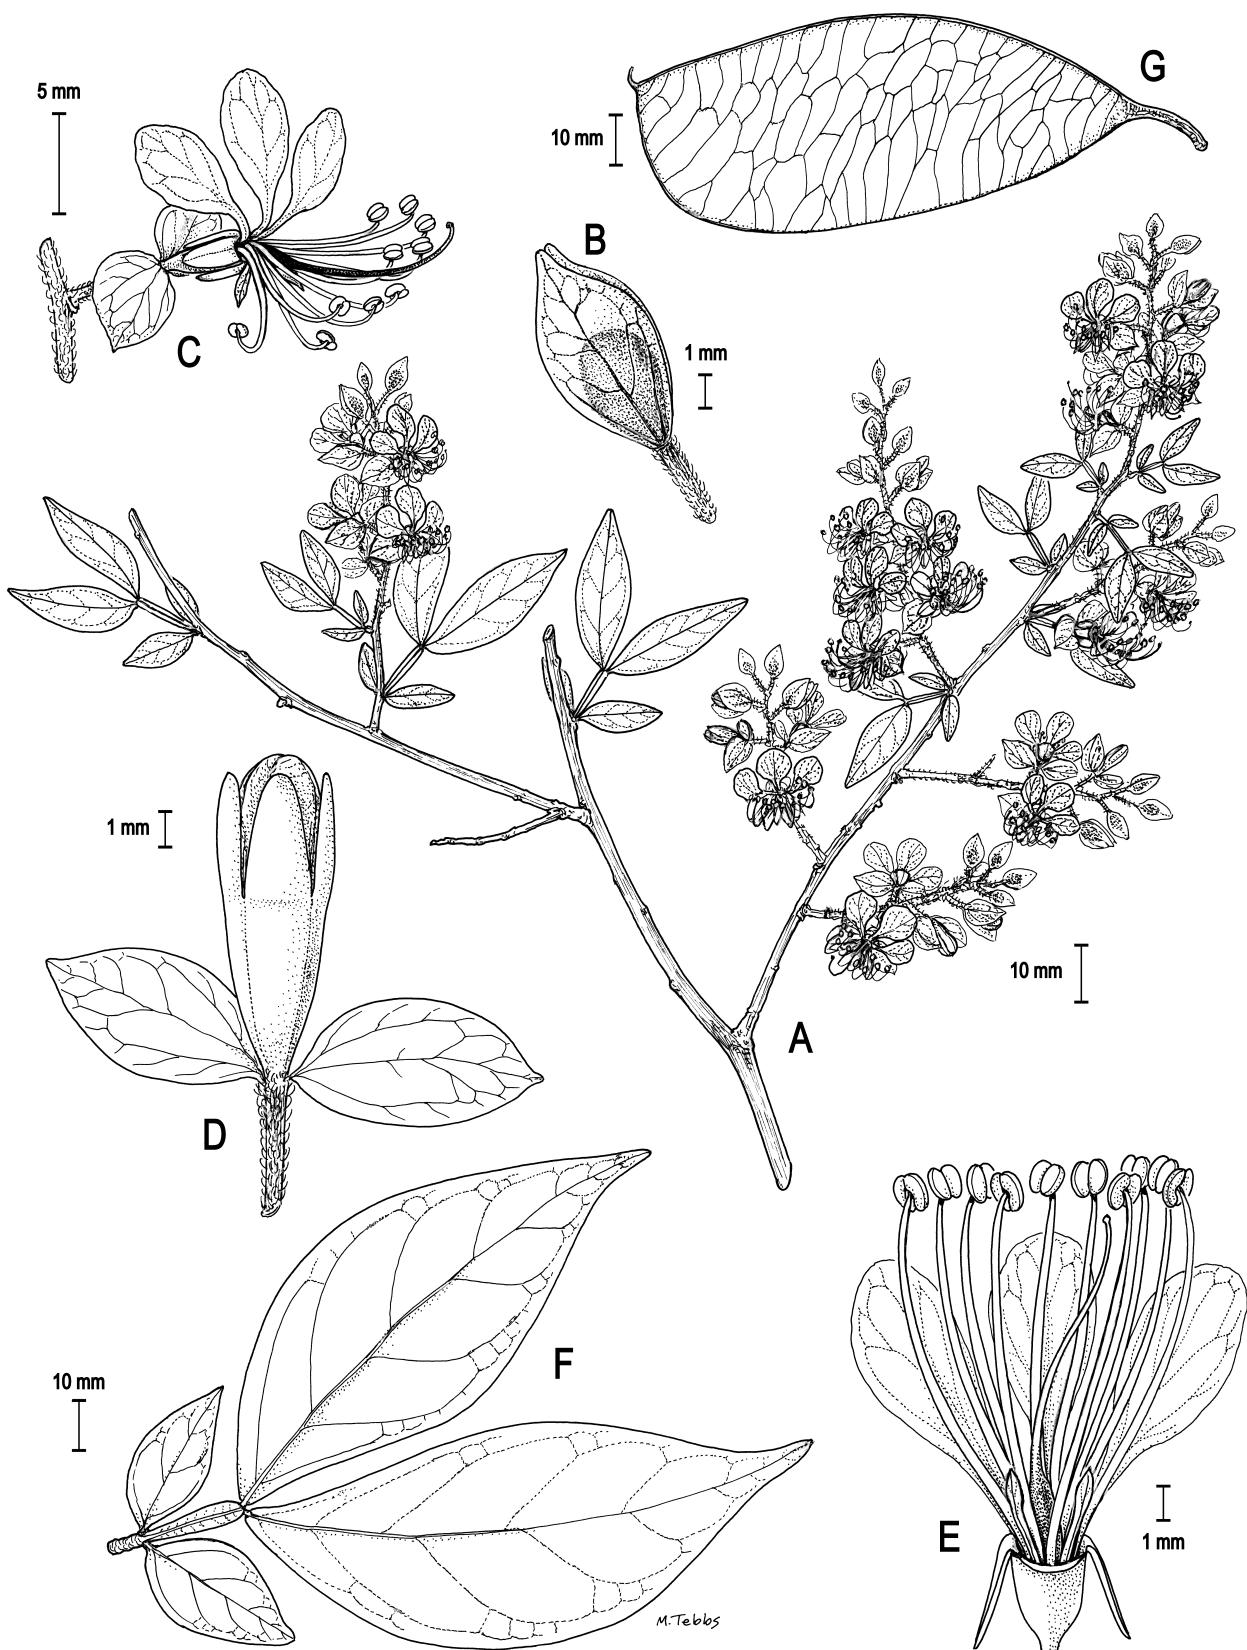

FIGURE 2. *Annea afzelii*. A: Flowering branch; B: Bud enclosed in petaloid bracteoles, their adaxial surfaces touching; C: Flower; D: Flower to show position of persistent petaloid bracteoles; E: Flower with calyx removed to show conspicuous adaxial and lateral petals and rudimentary abaxial petals; F: Leaf to show winged rachis and disparity in size between upper and lower leaflet pairs; G: Pod to show shape, absence of indumentum and unwinged upper suture. A. – E. Polhill 5218; F. Bruneau 1082; G. Carvalho 4338.

Habitat and Ecology:—Terre firma and seasonally inundated primary and secondary forest, along river banks, on lower slopes, granitic outcrops, reported on granitic, ferralytic or sandy soils; 0–1200 m elev.

Distribution:—Liberia, Côte D'Ivoire, Ghana, Togo, Benin, Nigeria, Cameroon and Equatorial Guinea (Fig. 1).

Conservation assessment:—We assess *A. afzelii* here as Least Concern (LC) according to the criteria of IUCN (2001) based on its wide geographic range.

Notes:—A species of diverse habit and habitat, in Cameroon, *Annea afzelii* is typically a small to medium sized tree 10–25 m, rarely attaining 35 m but can be a locally common understorey tree (*Mackinder* pers. obs. & *McKey* 1989–20), occasionally much smaller, c. 2m and shrubby, sometimes then with lianescence scrambling stems. *Leeuwenberg* 3342 (Cameroon) notes *A. afzelii* as forming a grove or monodominant stand. In Côte d'Ivoire, *A. afzelii* is often observed as shrub or shrubby tree 3–10 m of secondary forest. Several collectors record flowers as fragrant, *van Andel* 4244, *J.J.F.E. de Wilde* 8298 and *F. Hallé* 4328 in Cameroon as well as *Jongkind* 1782 in Ghana. Very rarely leaf formations other than 1–2 pairs have been seen. A leaf from a young tree had 3 leaflet pairs (*Jongkind* 9047) and in a mature collection, a leaf with 5 leaflets was noted, the fifth in a terminal position (*Kenfack* 1043).

2. *Annea laxiflora* (Benth.) Mackinder & Wieringa comb. nov. (Fig. 3)

Basionym:—*Cynometra laxiflora* Bentham (1865: 318). *Hymenostegia laxiflora* (Benth.) Harms in Engl. & Prantl (1897: 193). Type:—Angola. Golungo Alto, *Welwitsch* 561 (holotype LISU; isotypes COI, K!).

Cynometra laxiflora Benth. var. *nitidula* *Welwitsch* ex Oliver (1871: 318). Type:—Angola. Zenza do Golungo, *Welwitsch* 562 (holotype LISU, isotype K!).

Hymenostegia gilletii De Wildeman (1920: 239). *Hymenostegia laxiflora* Harms var. *gilletii* (De Wildeman) Baker f. (1928: 151). Type:—Democratic Republic of Congo. *Gillet* 4018 (holotype BR!).

Much branched shrub or tree 5–25 m tall, dbh 10 cm (5 m shrub)–90 cm (25 m tree); bark grey, bole fluted (*Donis* 1860). Twigs medium to dark brown, sparsely to moderately puberulous when young, hairs hooked (only visible at $\times 100$ or greater magnification), becoming glabrous with age, lenticels pale. Stipules in pairs, inconspicuous, fused at base, persistent, triangular, 1–2.5 mm long, apex acute. Leaves paripinnate, 1–2-jugate, small stalked gland often present between the terminal pair, petiole 8–15 mm long (1-jugate leaves) or 3–8 mm long (2-jugate leaves), mostly or only partly pulvinous, rachis 8–15 mm long, adaxially canaliculate, not winged, abaxially appearing terete, unevenly striate, glabrous or very sparsely puberulous, hairs hooked (only visible at $\times 100$ or greater magnification), leaflets sessile, ovate to rhombate, falcate, upper pair 2.5–12.3 \times 0.8–5.1 cm, much larger than lower pair, the upper pair 3 to 10 times longer than the lower pair, mostly glabrous, or almost so, hairs if present restricted to pulvini and adjacent leaflet margins, mid-vein sub-central, the proximal half of the leaflet slightly larger, crater-like glands (visible at $\times 10$ or greater magnification) present on the abaxial leaflet surface, 1–2 in proximal half, 0–5 in distal half, apex acuminate, base asymmetric. Bud scales absent. Inflorescence a lax 6–18-flowered terminal or axillary raceme, axis 4.4–7.2 cm long, including a 0.2–1.5 cm long peduncle, glabrous or sparsely puberulous, hairs hooked (only visible at $\times 100$ or greater magnification), bracts small, persistent until after anthesis, ovate, c. 1 \times 0.5 mm, pedicels 7–18 mm long, glabrous, portion below the bracteole 4–15 mm long, above the bracteole 1.5–4 mm long, bracteoles opposite, persistent, borne in the upper third of the pedicel but not directly below the hypanthium, petaloid, ovate to broadly obovate, 6–14 \times 5–8 mm, white, glabrous, base cordate; hypanthium 2–3.5 mm long, glabrous outside and inside. Sepals 4, white, pinkish, pale red or pale purple, reflexed after anthesis, slightly longer than the hypanthium, ciliate at apex, otherwise glabrous. Petals 5, narrowly spatulate, glabrous, pale yellow or yellow when first in flower, turning pink or red later, adaxial and lateral petals, similar in size, 8–9 \times 2–3 mm, abaxial petals smaller, c. 3 \times 1 mm. Stamens 10, filaments free, white, anthers brown. Ovary stipitate, brown, compressed, hairs c. 0.5 mm long, white, crinkled, occurring sparsely on faces but more densely so along margins, the marginal hairs persisting into young fruit, style and stigma white, stigma terminal, minute. Pod compressed, glabrous, 5.5–11 \times 2.8–5 cm, triangular, broadest towards apex, lower margin rounded, upper suture not broadened, beak 2–5 mm long, valves revolute after dehiscence.

Seeds 1–2, dark brown, ovoid, compressed, 15–20 × 14–17 × 4–5 mm (from Wagemans 2214). Seedling: first and subsequent leaves alternate, stipules not seen, leaflets sessile, 2-jugate, upper pair 58–66 × 26–35 mm, lower pair 26–32 × 15–22 mm (measurements from Donis 1860 & Wagemans 765).

FIGURE 3. *Annea laxiflora* A: Flowering branch; B: Close up of flower; C: Fallen flower to show post-mature petal colour change. A–C. M'Boungou 398. Photographer Xander van der Burgt.

Habitat and Ecology:—Primary forest near to waterfalls, along rivers, in valleys, on sides and tops of hills, on rocky ground; 0–300 m (possibly to 1100 m, see notes) elev.

Distribution:—Congo, Democratic Republic of Congo, Cabinda and Angola (**Fig. 1**).

Conservation assessment:—We assess *A. laxiflora* here as Least Concern (LC) according to the criteria of IUCN (2001) based on its relatively wide geographic range.

Notes:—*Donis 1860* (Democratic Republic of Congo) notes abundant regeneration from seedlings. Petal colour changes from white at anthesis to suffuse red when post-mature (van der Burgt *pers. comm.* and see **Fig. 3**). There are not many elevation records for this species, the highest, from Angola, is the rather large range 300–800 m (*Welwitsch 561*), while *Welwitsch 562*, also Angola, has been collected in an area of c. 1100 m elevation.

Acknowledgments

We would like to thank the curators of BM, BR, K, MA, MO & P for the loan of their *Hymenostegia* collections and Xander van der Burgt for permission to use his photographs of *Annea laxiflora*. We would also like to thank Margaret Tebbs for her illustration of *Annea afzelii*. We are grateful to two anonymous reviewers for their contributions.

Index to Numbered Collections seen for this study. For each species the exsiccatae presented below is ordered alphabetically by country, major political division and then by first collector. Within country, unlocalised collections are listed first.

1. *Annea afzelii* (Oliv.) Mackinder & Wieringa

BENIN. Atlantique: forêt de Djigbe, c. 6°53' N, 2°20' E, 8 November 1997 (st), *Lejoly* 97/ 26 (BR); Ouémé: Fouditi, 134m, c. 6°53' N, 2°38' E, 8 August 2001 (st), *Adjakidjè* 4693 (BENIN, WAG); CAMEROON. unknown: Sende (Gende?), 17 January 1909 (fl), *Büsgen* 475 (B); s.l., 1935 (fl), *Foury* 106 (IFAN, P); Central Province: 23 km from Yaoundé, road to Douala, 720m, 3°50' N, 11°20' E, 7 July 1961 (st), *Breteler* 1563 (K, L, P, U, WAG, YA); Mount Fébé, 3 km NW of Yaoundé, 950m, 3°55' N, 11°29' E, 15 March 1962 (fl), *Breteler* 2637 (A, BR, FI, G, K, LISC, M, MO, P, SL, UC, WAG, YA, Z); Cameroun: Makak, 3°33' N, 11°02' E, October 1938 (fl), *Jacques-Félix* 2263 (P, WAG); Koumou, c. 3°39' N, 11°31' E, 30 March 1954 (fr), *Letouzey s.n.* (BR); Makak, c. 3°33' N, 11°02' E, 5 May 1944 (st), *Letouzey* SFC 1134 (P); along a footpath heading west from Nkoabock II, 685m, 3°42.73' N, 11°14.92' E, 25 February 2007 (st), *Wieringa* 5796 (WAG, YA); Littoral: Left bank Dibombé R, near bridge in Loum-Solé road (km 11). 4.41 N 9.48 E, 150m, 4°41' N, 9°48' E, 25 April 1972 (fl), *Leeuwenberg* 9725 (BR, LISC, MO, P, PRE, UPS, WAG, YA); Mangombe, c. 3°49' N, 10°07' E, 1912 (st), *Lotz* 155 (B); Douala/Edea FR, Airstrip B, Tissongo, c. 3°36' N, 9°53' E, 2 August 1976 (st), *McKey* 156 (K, SCA, WAG, YA); Douala-Edea Forest, c. 3°33' N, 9°46' E, 1978 (fl), *D.W. Thomas* 171 (K, WAG); Douala/Edea FR, Transect B, Tissongo study area, c. 3°36' N, 9°53' E, 18 June 1976 (st), *Waterman* 156 (K); in the proposed Ebo forest reserve, 850 m on Dicam trail from Bekob camp, 900m, 4°21.09' N, 10°24.94' E, 10 March 2007 (st), *Wieringa* 5875 (K, WAG); 50 km NW of Eséka, W of Yaoundé, 100m, c. 3°50' N, 10°27' E, 25 November 1963 (fl), *W.J.J.O. de Wilde* 1346 (B, BR, EA, FHI, GENT, K, MO, NLI, P, PRE, WAG, YA, Z); South Province: Ntem River, riverbank of Ntem River, west of Ntemasi, 500m, 2°20' N, 10°35' E, 16 February 2001 (fl), *van Andel* 3201 (KRIBI, SCA, WAG, YA); Lobé, just downstreams Ile de Kingui, 20m, 2°51' N, 9°54' E, 31 October 2001 (fl), *van Andel* 4244 (KRIBI, SCA, WAG, YA); Lobé, 20m, 2°51' N, 9°54' E, 16 December 2001 (fr), *van Andel* 4268 (KRIBI, MO, P, WAG, YA); N bank of Lobé river, c. 2 km above the falls, riverine forest, c. 2°52' N, 9°54' E, 30 November 1968 (fl), *Bos* 3416 (BR, K, PRE, WAG); 6 km from Kribi, Ebolowa road, 2°54' N, 9°57' E, 27 November 1969 (st), *Bos* 5726 (WAG); 20 km from Kribi, 2 km N of Lolodorf road, SFIA logging road, 3°01' N, 10°03' E, 12 December 1969 (fl), *Bos* 5820 (BR, C, HBG, K, L, LD, LISC, LMA, MO, MPU, P, PRE, S, UPS, WAG, YA); 15 km SE of Kribi, between airstrip and Mt. Elephant, 2°50' N, 10°00' E, 26 March 1970 (fl), *Bos* 6637 (BR, K, LMA, M, MO, P, PRE, WAG); 4 km N. of km 20 Kribi - Lolodorf, 3°02' N, 10°03' E, 8 April 1970 (fl), *Bos* 6748 (BR, LMA, MO, P, WAG); Kribi, road to Ebolowa, 5 km SE of junction with road to Campo, 30m, 2°55' N, 9°56' E, 30 October 1995 (st), *Bruneau* 1082 (K, MT); Ebom Village, 6 km NE from Ebon, off road to Lolodorf. Wijma logging road, chantier 1222, Forest Block D2, 400m, 3°07' N, 10°45' E, 1 November 1995 (st), *Bruneau* 1126 (K, MT); In the Tropenbos research area. Block I2, 550m, 3°08' N, 10°44' E, 3 April 1996 (st), *Elad* 460 (BR, KRIBI, WAG); TDC, c. 2°39' N, 9°54' E, 28 November 1991 (fl), *F. Hallé* 4283 (WAG); TDC, c. 2°39' N, 9°54' E, 9 December 1991 (fl), *F. Hallé* 4328 (WAG); Mvini, 35 km E of Campo, c. 2°22' N, 10°06' E, 23 December 1983 (st), *Kaji* 25 (P); Campo FR, 20 km ENE of Ebodie, c. 2°38' N, 9°59' E, 1991 (st), *McKey* C91/3/ 24 (K); Ngonyayang Range above Bobondi, 550m, 3°18' N, 10°39' E, 8 April 1984 (fl, fr), *Polhill* 5218 (BR, K, L, PRE, WAG); Ntem river, west of Nyabessan, 300m, 2°24' N, 10°22' E, 1 December 1992 (st), *D.W. Thomas* 9618 (K, MO); Colline de Nkoltsia, 23 km NW de Bipindi, 3°11' N, 10°17' E, 25 November 1974 (st), *Villiers* 996 (P); 14 km on the road from Kribi to Ebolowa, 10m, 2°51' N, 10°01' E, 20 June 1975 (fl), *J.J.F.E. de Wilde* 8298 (BR, EA, K, MA, MO, P, PRE, SRGH, WAG, YA); Mimfia, 3°04' N, 10°23' E, (fl), *Zenker* s.n. (B, BR, MO); Mimfia, Lokundjethal, 3°04' N, 10°23' E, 1913 (fl), *Zenker* 43 (B, BOL, U, WAG); Bipinde, c. 3°05' N, 10°25' E, 1896 (fl), *Zenker* 1136 (HBG, K, P, S, WAG); Bipinde, c. 3°05' N, 10°25' E, 1902 (fl), *Zenker* 2439 (B, BR, HBG, K, L, P, S, WAG); Bipinde, c. 3°05' N, 10°25' E, 1903 (fl), *Zenker* 2645 (B, BR, HBG, K, L, P, S, WAG); Bipinde, c. 3°05' N, 10°25' E, 1904 (fl), *Zenker* 2674 (G, WAG);

Bipinde, c. 3°05' N, 10°25' E, 1904 (fl), *Zenker* 2784 (B, B, BR, HBG, K, L, MO, P, PRE, S, WAG); Bipinde, c. 3°05' N, 10°25' E, 1907 (fl), *Zenker* 3370 (BR); Bipinde, c. 3°05' N, 10°25' E, 1912 (fl), *Zenker* 4533 (BR, K, L, P, PRE, S); South-West Province: British Cameroons, Kumba district, N.A [Bakundu] Forest Reserve, c. 4°33' N, 9°26' E, 7 April 1960 (fl, fr), *Adebusuyi FHI* 44013 (FHI, K, WAG); Operation Raleigh, Bonanaza Plots, approx. 5 km W of Batoke along Batoke-Bakingili road, between plots no. 1 and 2, 190m, 4°03' N, 9°04' E, 13 October 1995 (st), *Bruneau* 1040 (K, MT); 3-5 km E of Limbe, proposed Mabeta-Maliwe reserve, at tip of peninsula, Dikulo Bay, c. 3°57' N, 9°13' E, 15 October 1995 (st), *Bruneau* 1051 (K); Korup National Park, P transect, near Science Camp, 100m, 5°01' N, 8°48' E, 16 October 2003 (fl), *Burgt* 632 (BR, G, K, MO, P, SCA, WAG, YA); near rocky mountain stream flowing westwards to village Bechati, 350m, 5°40' N, 9°56' E, 25 September 2006 (st), *Burgt* 863 (K, YA); Korup Forest Dynamics plot, 5°04' N, 8°51' E, 9 February 1998 (st), *Kenfack* 1043 (MO, WAG); 18 km W of Bota, a village W of Victoria, W Cameroun, between Batokke and Bakingeli, on base of Cameroun Mt, 100m, 4°03' N, 9°04' E, 11 October 1965 (fl), *Leeuwenberg* 6909 (B, BR, C, EA, FHI, GC, HBG, K, LISC, LUAI, MO, P, PRE, SRGH, UC, WAG, YA); In village, located on Mbongo Road c. 30 km WSW of Kumba, 4°33' N, 9°10' E, 21 November 1989 (st), *McKey* 1989/20 (WAG); Likomba, 15-35 km NE of Victoria, 50m, 4°05' N, 9°20' E, 22 October 1928 (st), *Mildbraed* 10537 (K); Limbe, Bakingini, forest above 'mile 11 village', 160m, 4°04.1' N, 9°03.5' E, 20 January 1994 (st), *Wieringa* 1937 (SCA, WAG).

EQUATORIAL GUINEA. Bioko Norte: Malabo-Punta Hermosa, estrada kms 14-15, 3°46' N, 8°53' E, 28 April 1990 (fl, fr), *Carvalho* 4338 (BR, K, MA, WAG); Rio Muni: Bata to Zona de Bomodi, c. 1°52' N, 9°47' E, 25 February 1994 (fl), *Carvalho* 5473 (BR, MA, WAG).

GHANA. unknown: s.l., 17 February 1912 (st), *Chipp* 111 (K); s.l., 20 February 1954 (fr), *C.J. Taylor* s.n. (BR); s.l., (st), *Unknown s.n.* (BR); s.l., February 1955 (fr), *Unknown s.n.* (BR); s.l., 20 May 1923 (st), *Vigne FH* 1042 (K); s.l., (fl), *Vigne FH* 4088 (BR, FHO, PRE); Ashanti Region: Atonso, c. 7°01' N, 1°19' W, 6 October 1949 (st), *Baldwin* 13512 (K, US); Juaso, Bobiri Forest Reserve, c. 6°40' N, 1°19' W, 19 January 1972 (fl), *Enti Sp* 535 (BR); Juaso, c. 6°35' N, 1°07' W, June 1926 (st), *Irvine* 325 (K); Armentia, 1219m, c. 6°13' N, 1°10' W, March 1930 (st), *Vigne FH* 1888 (FHO, K); Brong-Ahafo Region: Tano river, c. 75 km W of Kumasi, c. 6°39' N, 2°25' W, 23 December 1963 (fl), *Oldeman* 814 (B, BR, FHI, G, GENT, IFAN, K, LD, MO, P, S, WAG, Z); Central Region: Dunkwa, c. 5°58' N, 1°47' W, 2 January 1920 (st), *Dalziel* 68 (K); Dunkwa, c. 5°58' N, 1°47' W, 20 May 1923 (st), *Vigne FH* 882 (K); Cape Coast, 30m, c. 5°07' N, 1°15' W, November 1924 (st), *Vigne FH* 946 (K); Dunkwa, 152m, c. 5°58' N, 1°47' W, July 1941 (fl), *Vigne FH* 4762 (BM, BR); Eastern Region: Ayimensu, Krobo District, c. 5°47' N, 0°11' W, March 1939 (fr), *Akpabla* 842 (GC, K, WAG); N. Scarp Reserve, c. 6°42' N, 0°45' W, 16 December 1934 (fl), *Beveridge* 86 (BM, BR); Mile 33 Mamfe-Adawso road, 5°57' N, 0°07' W, 27 November 1970 (st), *Bigger* 2465 (K); at the foot of Aburi Hills, c. 5°48' N, 0°11' W, 22 October 1966 (fl), *Botokro* GC 37354 (GC); Aburi Rd, foot of scarp, c. 5°48' N, 0°11' W, October 1973 (st), *Enti R* 1142 (K); near Akyease, c. 5°50' N, 1°00' W, October 1921 (st), *Fishlock* 62 (K); Akropong, Akwapim, c. 5°58' N, 0°05' W, August 1927 (st), *Irvine* 771 (GC); Aburi Hills, c. 5°52' N, 0°10' W, 17 November 1899 (st), *W.H. Johnson* 289 (GC, K); Aburi Hills, 457m, c. 5°52' N, 0°10' W, 24 February 1900 (st), *W.H. Johnson* 615 (GC, K); Aburi Hills, c. 5°52' N, 0°10' W, 2 March 1900 (st), *W.H. Johnson* 621 (GC, K); Atewa Range Forest Reserve, along the Old Geological Survey road, 500m, 6°13.8' N, 0°33.5' W, 19 October 1994 (fl), *Jongkind* 1782 (MO, NBG, PRE, WAG); Odumasi, 152m, c. 6°08' N, 0°01' E, July 1927 (st), *Moor (Mrs)* 77 (K); Aburi Scarp, c. 5°48' N, 0°11' W, November 1951 (fl), *Morton* GC 6131 (GC, K, WAG); ravine at bottom of Aburi Scarp, c. 5°48' N, 0°11' W, 19 February 1952 (fl), *Morton* GC 6449 (GC, K, WAG); Atewa Range Forest Reserve, along road from Kibi to Anyinase, travelling westward, 550 - 600m, 6°10' N, 0°36' W, 16 November 1995 (fl), *H.H. Schmidt* 1726 (MO, PRE, WAG); Sra, 91m, c. 6°06' N, 0°02' W, June 1927 (st), *Vigne FH* 293 (K); Greater Accra Region: Dodowah, c. 5°53' N, 0°06' W, February 1933 (st), *Irvine* 1972 (K); Western Region: Ankobra River, c. 4°56' N, 2°14' W, 18 December 1901 (st), *W.H. Johnson* 922 (GC, K).

IVORY COAST. unknown: s.l., (fl), *Aké Assi* 28 (BR, HBG, K, P, WAG); Patopara, 1932 (fr), *Aubréville SF* 1213 (B, P); s.l., 21 April 1995 (fr), *Breteler* 13352 (MO, S, WAG); A? [or S or even G?]hana, 21 October 1950

(fl), *Nozeran s.n.* (MPU); Abengourou: région du Moyen-Comoé (Indénié), entre Bebou et Mbasso, c. 6°20' N, 3°26' W, 24 December 1909 (fl), *Chevalier* 22646 (BR, P, WAG); Abidjan: Abidjan, c. 5°20' N, 4°00' W, 1928 (fl), *Aubréville SF 17* (BR, P); Abidjan, c. 5°19' N, 4°02' W, 1 February 1929 (fl), *Aubréville SF 81* (B, BR, HBG, P); Abidjan. Botanical Garden of Cocody University, c. 5°19' N, 4°00' W, 8 March 1997 (st), *Breteler* 13738 (WAG); Abidjan. Banco forest Arboretum, c. 5°25' N, 4°03' W, 8 March 1997 (fl), *Breteler* 13744 (BR, WAG); Banco. ancien arboretum, 5°24.00' N, 4°04.50' W, 29 January 1990 (st), *Chatelain* 26 (CSRS); Banco, c. 5°23' N, 4°03' W, 25 April 1967 (st), *Cremers* 623 (BR); Banco Forest reserve, c. 5°23' N, 4°03' W, 15 June 1967 (st), *Cremers* 623 (BR, P); forêt du Banco, c. 5°23' N, 4°03' W, 21 July 1967 (st), *F. Hallé* 1287 (BR); Rocher de Brafouédi, near Bécédi, on the road to Sikensi, 100m, c. 5°39' N, 4°34' W, 23 January 1970 (fl), *de Koning* 52 (BR, C, E, G, K, MA, MO, WAG); Banco Forest Reserve, western central part, 5°23' N, 4°04' W, 21 November 1973 (fl), *de Koning* 2777 (BR, E, MO, WAG); Banco Forest Reserve. Route Reste, 5°22' N, 4°03' W, 7 December 1973 (fl), *de Koning* 2889 (BR, E, MO, WAG); Banco Forest Reserve, on the right handside of the entry, to Agban village, 5°22' N, 4°03' W, 5 November 1974 (st), *de Koning* 4650 (BR, E, K, MO, WAG); Banco Forest Reserve, near entry, 5°22' N, 4°03' W, 20 December 1974 (st), *de Koning* 5050 (BR, E, MO, WAG); Banco Forest Reserve, Chemin de l'Iroko, 5°23' N, 4°03' W, 27 February 1975 (st), *de Koning* 5422 (WAG); Abidjan, Banco Forest Reserve, near main entrance, on left-hand side of the road, c. 5°22' N, 4°03' W, 8 August 1975 (fl), *de Koning* 5899 (BR, C, E, G, K, MA, MO, WAG); Anguededou forest, near Agneby river, c. 5°23' N, 4°08' W, 23 November 1975 (fl), *de Koning* 6201 (BR, EA, K, MO, NY, WAG); Banco Forest Reseve, c. 5°23' N, 4°03' W, 2 June 1976 (st), *de Koning* 6947 (MO, WAG); Sikensi, 30m, c. 5°40' N, 4°34' W, 12 July 2004 (st), *Kouassi* 27 (BR); near brafouédi, 75km NW of Abidjan, 100m, 5°37' N, 4°35' W, 24 April 1959 (fr), *Leeuwenberg* 3342 (WAG); rocher de Brafouédi, 5°39' N, 4°34' W, 13 July 1955 (st), *Mière s.n.* (BR); P.N.
