Abstract

In order to better understand species delimitation in the *Pluteus glaucotinctus* species complex, we present a detailed study based on morphological and DNA sequence (nrITS + *tef1*) data. *Pluteus glaucotinctus* sensu stricto is known only from the type collection (Democratic Republic of the Congo), which is re-examined here. Four other species are recognized in this complex and described herein as new: *P. izurun* from Spain, *P. meridionalis* from Brazil, *P. padanilus* from India and *P. thoenii* from Africa. Phylogenetic analyses based on nrITS + *tef1* sequence data support the recognition of all species in this complex.

Key words: nrITS, Pluteaceae, section *Pluteus*, species delimitation, *tef1*

Introduction

The genus *Pluteus* Fr. (Pluteaceae, Agaricales) comprises ca. 300 species with a circumglobal distribution (Kirk *et al.* 2008) and is very common in forested areas from boreal to tropical regions. The genus is found primarily in association with well-rotted wood and it is characterized by free lamellae, absence of a volva, pinkish spore print, inamyloid basidiospores and inverse hymenophoral trama (Singer 1986). Recent molecular and morphological studies (Minnis *et al.* 2006; Corriol & Moreau 2007; Menolli *et al.* 2010; Vizzini & Ercole 2011; Justo *et al.* 2011a, b) found *Pluteus* to include some annulate species previously placed in the genus *Chaemaeota* (W.G. Sm.) Earle and also have typically supported the traditional infrageneric subdivision into three sections: *Pluteus*, *Celluloderma* Fayod and *Hispidoderma* Fayod.

According to the infrageneric classification of *Pluteus* proposed by Singer (1959, 1986) and as clarified by DNA sequence data (Justo *et al.* 2011a, b), *Pluteus* sect. *Pluteus* includes species with a pileipellis as a cutis, with metuloid pleurocystidia, as well as species with indistinct metuloids [*Pluteus albostipitatus* (Dennis) Singer] or with non-metuloid pleurocystidia (*Pluteus glaucotinctus*).

Justo *et al.* (2011b) recognized sixteen well-supported clades in *Pluteus* sect. *Pluteus*, most of which are represented by species complexes with apparent intercontinental distributions. Many of these have been investigated (Justo *et al.* 2014) and others require further molecular and morphological studies to better understand species delimitation, diversity, and biogeography in the genus. In the present article we critically examine the widespread species complex around *P. glaucotinctus* using morphological approaches and molecular phylogenies based on two loci, the nuclear ribosomal internal transcribed spacers region (nrITS) and translation-elongation factor 1-alpha (*tef1* a single-copy, protein-coding gene).

Basidiospores [30/1/1] 6.5–8.5(–9.0) × 5.5–7.5 µm (Q = 1.10–1.17; Qm = 1.15; Lm = 7.7 µm; Wm = 6.7 µm), subglobose to broadly ellipsoid, inamyloid, hyaline, smooth, thick-walled. *Pleurocystidia* 55–85 × 18.0–32 µm; ovoid, clavate or oblong, with rounded apices, colorless, thin-walled. *Cheilocystidia* 53–94 × 12.0–15.0 µm; narrowly utriform, cylindrical, lageniform, flexuous, colorless, thin-walled. *Pileipellis* a cutis; terminal elements 70–105 × 10.0–20 µm; cylindrical or tapering towards apex; colorless or with brown pigments; thin-walled. *Stipitipellis* a cutis; hyphae 5.0–15.0 µm wide; colorless; thin-walled. *Clamp-connections* not observed.

Etymology:—*thoenii* in honor of the collector of the holotype, Daniel Thoen, and for his contribution to the knowledge of fungi from tropical Africa.

Distribution:—Africa: Known only from Democratic Republic of the Congo.

Specimen examined:—DEMOCRATIC REPUBLIC OF THE CONGO. Haut-Katanga: Kipopo, 19 December 1972, *Thoen* 5546 (BR!; nrITS: HM562132; *tef1*: KJ010051).

Notes:—Despite the lack of macro-morphological data from fresh collections of *P. thoenii*, we consider the DNA sequences, the shape of the basidiospores (Qm = 1.15) and the size of the cheilocystidia (up to 94 µm long) as sufficiently distinctive characters to propose this new species. *Pluteus thoenii* has been up until now only represented by the holotype, which represents a single herbarium collection from more than 50 years ago that was previously identified by Horak & Heinemann (1978) as *P. glaucotinctus*.

Acknowledgments

The authors thank the curator of BR for managing the loans of the specimens from Africa and Luiz Antonio S. Ramos for assistance with formatting the plates. N. Menolli Jr. and M. Capelari thank Fernanda Karstedt and L.A.S. Ramos for collecting some specimens of *P. meridionalis*; Francisco Kuhar for the suggestion of the name *P. meridionalis*, the “Fundação de Amparo à Pesquisa do Estado de São Paulo” (FAPESP grants 04/04319-2, 09/53272-2) and the “Conselho Nacional de Desenvolvimento Científico e Tecnológico” (CNPq fellowships) for financial support. A. Justo acknowledges support from the National Science Foundation grant DEB 0933081. A.M. Minnis expresses gratitude for support from Daniel L. Lindner and U.S. Forest Service funds.
