### **Abstract**

*Hsiaotycoris tuberculatus* Lü, Zhao & Cai, **gen. & sp. nov.** of the harpactorine tribe Dicrotelini from China is described and illustrated. A key and diagnostic characters are provided to distinguish the new genus from morphologically related genera.

**Key words:** Reduviidae, Harpactorinae, taxonomy, China, new genus, new species

### **Introduction**

Dicrotelini is a small tribe of the reduviid subfamily Harpactorinae. Miller (1954) reviewed and keyed nine genera of this tribe. Additional five genera of this tribe were established by Malipatil (1988), Cai (1995), and Tomokuni & Cai (2002). Most genera are narrowly distributed in the Oriental and Australian Regions. Four genera of the tribe, *Henricohahnia* Brddin, 1900, *Tapirocoris* Miller, 1954, *Karenocoris* Miller, 1954, and *Yangicoris* Cai, 1995, have been reported from China (Miller 1954; Hsiao & Ren 1981, Cai 1995, Cai & Tomokuni 2003). During the field trips to Xishuangbanna, Yunnan Province, a new genus and species of this tribe was found and is described here. Nothing is known of the biology and ecology of this species.

### **Materials and methods**

This study is based on materials preserved in the Entomological Museum of the China Agricultural University, Beijing (CAU). Male genitalia were soaked in hot 10% KOH
