The genus name *Forestia* was first used by Salvatore Trinchese (1881: 121, 122) for a new species of nudibranch, *Forestia mirabilis*, from Naples. Nils Hjalmar Odhner (1907: 26, 30), while studying the Opisthobranchia and Pteropoda in the Swedish State Museum, treated the genus *Forestia* Trinchese, 1881, and referred *Eolis albicans* Friele & Hansen, 1876, to it. Evans (1922: 439), in his study on the genus *Calma* Alder & Hancock, 1855 (Calmidae: Nudibranchia: Mollusca) stated that “[t]he genus has been recorded only from European waters, and contains *Calma glaucoides* [Alder & Hancock, 1855], *Eolis albicans* [Friele & Hansen, 1876], and the *Forestia mirabilis* [...] All three will probably be found on re-examination to belong to one species, *C. glaucoides*.” Evan’s (1922) postulation has been adhered to by most subsequent authors.
