Abstract

The clade *Hoplocercinae* includes 13 species assigned to three taxa traditionally ranked as genera—*Enyalioides*, *Hoplocercus*, and *Morunasaurus*—, and distributed on both sides of the Andes from Panama to Brazil. We provide a revised taxonomy of *Hoplocercinae* including synonymies, diagnoses, standardized descriptions, distributions, notes on color and natural history, and a key for species identification. We also propose vernacular names in English and Spanish for all species.

Key words: *Enyalioides*, *Hoplocercus*, Iguanidae, lizards, *Morunasaurus*, Neotropics, taxonomy
