### Introduction

We present in the following an *Errata Corrigenda* for Abrantes *et al.* (2010) Table 2 and general counting. Furthermore, we include all additional records for Brazilian Collembola during 2010 and 2011 as an update for the species list. The update was made following the same methodology and criteria as Culik and Zeppelini (2003), and Abrantes *et al.* (2010). All data will fit the same table marked differently to be recognized at glance. The references presented here are restricted to the citations concerning the update only; therefore the references presented in Culik and Zeppelini (2003), and Abrantes *et al.* (2010) will not be repeated.

*Errata Corrigenda* Abrantes *et al.* (2010):

1—**Results and Discussion**, page 2. The first paragraph:

“The updated number of Collembola species recorded from Brazil up to September 2009 is 270, distributed in 19 families and 92 genera (Tab. 2). There was an increase of 71 species and 12 genera since Culik and Zeppelini (2003). The species *Dicranocentrus silvestrii* var. *annulata* (Börner, 1906), is supposed to be the completely developed adult form of *D. silvestri* Absolon, therefore it was not included in the total number of species and is not considered in further discussion.”

Must read:

“The updated number of Collembola species recorded from Brazil up to September 2009 is 270, distributed in 19 families and 92 genera (Tab. 2). Since Culik and Zeppelini (2003) there was an increase of 71 records, 67 species and 12 genera when all records are included, the exception is made for the species *Dicranocentrus silvestrii* var. *annulata* (Börner, 1906), which is considered a synonym in the following discussion (Culik and Zeppelini 2003).”
