Abstract

The paper reported three new species from Taiwan, i.e. *Xizicus (Eoxizicus) taiwanensis* sp. nov., *Xizicus (Axizicus) falcata* sp. nov. and *Decma (Decma) brachyptera* sp. nov., supplied the descriptions and illustrations.

Key words: Meconematini, new species, *Xizicus*, *Decma*, Taiwan

Four species of the subfamily Meconematinae were recorded from Taiwan, i.e. *Neophisis (Indophisis) kotoshoensis* (Shiraki, 1930), *Taiyalia sedequeiana* Yamasaki, 1992, *Taiyalia squolyequiana* Yamasaki, 1992, and *Leptoteratura (Leptoteratura) taiwana* Yamasaki, 1987. One of the authors (Du Xi Cui) co-operated with the National Museum of Natural Science, Taizhong where she studied material in the collection. We discovered three new species of the tribe Meconematini, namely *Xizicus (Eoxizicus) taiwanensis* sp. nov., *Xizicus (Axizicus) falcata* sp. nov. and *Decma (Decma) brachyptera* sp. nov. which are described here. The type material is deposited in the Museum of Hebei University.

1. *Xizicus (Axizicus) falcata* Chang, Du & Shi sp. nov.

Figs. 1–8

Male. Body small, comparatively thinner and longer. Head stout and short, fastigium frontis vertical, fastigium verticis conical, protruding, apex rounded with a thin longitudinal furrow. Eyes globular.

Pronotum shorter, anterior margin straight, posterior margin rounded, transversal sulci indistinct; lateral lobes longer than deep; humeral sinus shallow.

All femora without spines on ventral surface. Forecoxa with a spine, foretibiae with 6 spines on inner side and 5 spines on outer side (including a pair of apical spines); tibial tympana open on both sides. Mesotibiae with 5 spines on inner side and 6 spines on outer side of ventral surface. Posttibiae with 27–31 spines on internal and external sides of dorsal surface separately, bearing a pair of dorsal apical spurs and two pairs of ventral apical spurs; genicular lobes with apices rounded.

Tegmina narrower and longer, surpassing apices of postfemora, anterior and posterior margins parallel, apices rounded. Stridulatory area concealed under pronotum. Hind wings longer than tegmina.

Tenth abdominal tergite longer, centre of posterior margin with a shallow notch, the lateral lobes moderately elongated posteriorly. Epiproct long tongue-shaped. Cerci with 2/3 base stout, cylindrical, apical area separated into two branches, outer branch short, slightly curved upwards, apex rounded; inner branch long, falcate, curved inwards, apex acute. Subgenital plate elongate, broad, basal area with median sulcus, posterior margin rounded. Styli medium-length, apices subacute on lateral margins of subapex of subgenital plate.

Body green. Eyes reddish brown. Disc of pronotum with a pair of longitudinal light brown stripes. Genicular lobes of postfemora brown, spines of posttibia on dorsal surface blackish brown, apices of spurs and claws blackish brown.
