Abstract

We describe the new species *Anolis peucephilus* sp. nov. from the Pacific versant of southern Mexico. *Anolis peucephilus* differs from all congeners by having a combination of (1) smooth ventral scales; (2) usually a patch of three greatly enlarged supraocular scales; (3) extremely short hind legs, longest toe of adpressed hind leg reaching to a point between levels of axilla and ear opening, ratio shank length/snout-vent length 0.18–0.21; (4) circumnasal usually in contact with first supralabial; and (5) a large yellowish orange dewlap in males and a very small to small white dewlap in females. In external morphology, *A. peucephilus* is most similar to *A. omiltemanus* from which it differs by having even shorter hind legs with the longest toe of adpressed hind leg reaching to a point between levels of axilla and ear opening (versus usually to ear opening, occasionally to slightly beyond ear opening or to a point between shoulder and ear opening in *A. omiltemanus*), a slightly larger dewlap in females, to 64 mm² (versus to 41 mm² in *A. omiltemanus*), the circumnasal usually in contact with the first supralabial (versus those scales separated by the presence of a subnasal in *A. omiltemanus*), and 4–6 internasal scales in the new species (versus usually 6–7 in *A. omiltemanus*). Furthermore, *A. peucephilus* differs from *A. omiltemanus* in hemipenial morphology (no finger-like processus on asulcate side in *A. peucephilus* versus such a processus present in *A. omiltemanus*). Also, in a preliminary molecular genetic analysis of the mitochondrial CO1 gene fragment, *A. peucephilus* has a genetic distance of 11.5% from *A. omiltemanus*. *Anolis peucephilus* was collected at night while the lizards were sleeping in pine trees, 2–10 m above the ground.

Key words: *Anolis peucephilus* sp. nov.; Dactyloidae; Mexico; new species; Oaxaca; Reptilia; Squamata

Resumen

Describimos la nueva especie *Anolis peucephilus* de la vertiente Pacífico del sureste de México. *Anolis peucephilus* difiere de todos sus congéneres al tener una combinación de (1) escamas ventrales lisas; (2) usualmente un parche de tres escamas supraoculares fuertemente agrandadas; (3) patas traseras extremadamente cortas, el dedo más largo de la pata trasera presionado paralelo al cuerpo alcanza un punto entre el nivel de la axila y la apertura timpánica, proporción de la longitud de la pierna/longitud hocico-cloaca 0.18–0.21; (4) circumnasal usualmente en contacto con la primera supralabial; y (5) presencia de un gran abanico gular amarillo naranja en machos y un pequeño abanico gular blanco en hembras. En morfología externa, *A. peucephilus* es más similar a *A. omiltemanus* con el cual la diferencia es la presencia de patas traseras aún más cortas, con el dedo más largo de la pata trasera alcanzando un punto entre el nivel de axila y la apertura timpánica (versus usualmente alcanzando la apertura timpánica y ocasionalmente ligeramente más allá de ella o entre ella y el hombro en *A. omiltemanus*), un abanico gular mas grande en hembras, hasta 64 mm² (versus hasta 41 mm² in *A. omiltemanus*), la circumnasal usualmente en contacto con la primer supralabial (versus aquellas escamas separadas por la presencia de una subnasal en *A. omiltemanus*), y 4–6 escamas internasales (versus 6–7 en *A. omiltemanus*). *Anolis peucephilus* también se diferencia de *A. omiltemanus* en la morfología de los hemipenes (sin proceso en forma de dedo en lado asulcado en *A. peucephilus* versus tal proceso presente en *A. omiltemanus*). Además, en un análisis preliminar de genética molecular de un fragmento del gen mitocondrial CO1, *A. peucephilus* presenta una distancia genética de 11.5% de *A. omiltemanus*. Los individuos de *A. peucephilus* fueron colectados de noche mientras dormían en pinos, entre 2–10 metros sobre el suelo.

Acknowledgments

Collecting and exportation permits were issued by Martín Vargas Prieto, Secretaría del Medio Ambiente y Recursos Naturales, México D.F., Mexico. We thank Larry David Wilson for helpful comments on an early draft of this manuscript. For the loan of and/or access to specimens, we thank Alan Resetar, Field Museum of Natural History (FMNH), Chicago; Victor Hugo Reynoso, Instituto de Biología (IBH), Universidad Nacional Autónoma de México, México D.F.; William E. Duellman and John E. Simmons, University of Kansas, Natural History Museum (KU), Lawrence; James Hanken, Jonathan Losos, and José P. Rosado, Museum of Comparative Zoology, Harvard University (MCZ), Cambridge; Adrián Nieto Montes de Oca, Facultad de Ciencias, Museo de Zoología (MZFC), Universidad Nacional Autónoma de México, México D.F., Mexico; Jimmy A. McGuire and Carol L. Spencer, University of California, Museum of Vertebrate Zoology (MVZ), Berkeley; Christopher A. Phillips and Daniel B.
