Abstract

The Neotropical praying mantis genus *Miobantia* Giglio-Tos, 1917 currently includes six species with a complex taxonomic history. Although frequently found in the atlantic forest of Brazil, little is known about these species. Several obstacles make it difficult identifying these mantids, including high levels of sexual dimorphism and both sexes known only for one of the six currently known species. The taxonomic boundaries among the species of *Miobantia* are proposed in this work, through a cladistic analysis using 99 morphological characters, and the analysis of sequence variation of approximately 700 bp of the mitochondrial gene COI for association of dimorphic sexes and nymphs. Additionally, an investigation of intraspecific variation is conducted based on a large number of specimens of *M. fuscata* (Giglio-Tos) in order to choose the most relevant features for the separation of the species to be used in taxonomic descriptions and identification keys. The male of *M. aptera* Giglio-Tos, and the females of *M. ciliata* (Stål) and *M. fuscata* are described for the first time, and redescription of the males of these and the female of *M. aptera*, are provided based on additional data. *Miobantia nebulosa* (Giglio-Tos) is herein re-described (male genitalia included) and proposed as a junior synonym of *M. rustica* (Fabr.). Additionally, four new species are here described, totaling nine species for the genus: *M. immanis* n. sp. (Espírito Santo, Brazil), *M. arctissima* n. sp. (Espírito Santo, Brazil), *M. sulista* n. sp. (Santa Catarina and Rio Grande do Sul, Brazil; San Bernardino, Paraguay), and *M. nordestina* n. sp. (Bahia, Brazil); both sexes of all new species are described, except for *M. arctissima*, which remain known by males only. Identification keys and figures of diagnostic features are provided for both males and females of all valid species. The species distribution is mapped according to literature data and 50 new records.

Key words: praying mantis, Miopteryginae, COI, DNA barcoding

valuable loans of *Miobantia* specimens. Photographs of the type of *M. ciliata* are a courtesy of the *Naturhistoriska Riksmuseets* (Stockholm, Sweden), and were kindly sent by Gunvi Lindberg and Kjell A. Johanson. Peter Schwendinger (*Muséum d'Histoire Naturelle*, Switzerland), took the photographs of *M. phryganea*. The photographs of the type of *M. rustica* were provided by George Beccaloni and are copyrighted to the Natural History Museum, London (England). Gavin Svenson (Cleveland Museum of Natural History) kindly took the images of the general morphology and labels of this type during his visit to the Natural History Museum, and Martin Stieve dissected and imaged the male genitalia. Eliomar Menezes promptly helped with the process of obtention of the loan from MZUEFS. The molecular methodology was supported by Valéria Fagundes (UFES), who helpfully provided the technical equipments and lab workspace, as well as by the help of many colleagues of the *Laboratório de Genética Animal* and of the *Núcleo de Genética Aplicada à Conservação da Biodiversidade* (UFES) especially Mariana S. Azevedo, Lucas A. Vianna, Arturo B. Martinelli, Lorena L. Dinelli, Victor H. Collombi, Rosana R. A. Nunes, Cristina D. A. Nogueira, and Juliana F. Justino. Alexandre P. Aguiar (UFES) contributed with many important suggestions to the manuscript and fully supported this research throughout its development; without his comments and assistance the present work would be quite limited. Mariana, and the lab colleagues Adriana C. B. Ramos, Anazélia M. Tedesco, Bernardo F. Santos, Fabiana G. Rampinelli, and Maria C. Carreiro, also helped with valuable discussions, in addition to contributions with collecting and sorting of many specimens of *Miobantia*. Gavin Svenson and Celso O. Azevedo (UFES) contributed with many enriching comments on the manuscript.
