Abstract

Two new species of *Ochthebius* Leach (Coleoptera: Hydraenidae) are described from Turkey: *O. (s.str.) halophilus* (Kırıkkale Province) and *O. (Asiobates) arator* (Kütahya and Uşak Provinces). The former is the first member of the *Ochthebius* (s.str.) *notabilis* species group from Turkey, and the latter belongs to the *O. (Asiobates) bicolor* group. Both of the new species are characterized by a remarkable aedeagus and are very probably endemic to Turkey.

Key words: Coleoptera, Hydraenidae, *Asiobates*, *Ochthebius notabilis* group, taxonomy, new species, Turkey

Introduction

To date, 74 species of *Ochthebius* Leach have been reported from Turkey (Ertorun *et al.* 2011). Twenty-six of these species are regarded as endemic to Turkey. Two new endemic species, collected in the provinces Kırıkkale and Kütahya/Uşak respectively, are described in this paper.

Acronyms:

CEE Coll. Ertorun, Eskişehir, Turkey
NMW Naturhistorisches Museum Wien, Austria

Material and methods

Materials of this study were collected using sieves. The specimens were preserved in 70% ethanol. Genitalia of the specimens were dissected under Leica-MZ 12.5 stereo microscope and line drawings of the specimens were made by drawing tube. After examination, all dissected parts of the specimens were mounted on 5 x 10 mm. cards, pinned on styrofoam and labelled.

The material examined is deposited in institutional and private collections as follows: CEE—Coll. Ertorun, Eskişehir, Turkey; NMW—Naturhistorisches Museum Wien, Austria.

Taxonomy

Ochthebius (s.str.) *halophilus* sp. nov.

Type locality. Çoğul salt pond, 39°58'30"N 34°03'50"E, ca. 637 m a.s.l., ca. 4.5 km north-east of Delice, Kırıkkale Province, Central Anatolia, Turkey (Fig. 1a).

The shape of the distal lobe is somewhat intermediate between those of *Ochthebius annae* (Jäch 1990: Fig. 24) and *O. naxianus* (Jäch 1990: Fig. 26): it is more robust and less elongate than in *O. annae*, and it is distinctly longer and more sinuous than in *O. naxianus*.

To a certain degree, the distal lobe of *O. arator* is also somewhat similar to that of *O. laticollis*, but it is slenderer and more sinuous than in the latter (externally, *O. laticollis* differs significantly in the very densely punctate head and pronotum).

Discussion. *Ochthebius striatus* is widely distributed from Croatia to southern Russia and Israel. It is so far known from 22 Turkish provinces (Ertorun *et al.* 2011), being one of the most common Turkish species of this genus. It has, however, never been recorded from Kütahya or Uşak.

It should be noted here, that *O. striatus* might well be a complex of different species. Comprehensive comparative studies on the interpopulational variability of the aedeagus of *O. striatus* s.l. have not been carried out so far.

Etymology. Arator (Latin): ploughman. The name refers to the remarkable shape of the aedeagal distal lobe, which somewhat resembles a traditional plough.

Distribution. So far known only from two localites in western Turkey (Kütahya and Uşak Provinces).

Acknowledgements

The first author is obliged to the Anadolu University Research Foundation for financial support [project number 1105F093].

We are grateful to T. Söylemez (Eskişehir Osmangazi University, Eskişehir) for collecting the type material of *Ochthebius halophilus*. M.B. Mutlu (Anadolu University, Eskişehir) provided the habitat photograph and valuable ecological information on the type locality of this species. The habitus photographs of *Ochthebius halophilus* were made by M. Brojer and B. Dvorak (NMW).

The photograph of the type locality of *Ochthebius arator* was made by C. Aydını (Anadolu University, Eskişehir).
