Abstract

The world genera of Mycetophagidae are reviewed and four new genera described. Several adult features of Mycetophagidae are discussed, and some newly discovered secondary sexual characters are described and illustrated. A key is given to the adults of all mycetophagid genera. The following new genera and species are proposed: *Afrotyphaeola* gen. n. (South Africa), *A. natalensis* sp. n. (South Africa), *Neotriphyllus* gen. n. (southwestern USA to Central America), *Nototriphyllus* gen. n. (New Zealand, Madagascar, Chile and Argentina), *N. araucania* sp. n. (Chile, Argentina), *Zeclaviger* gen. n. (New Zealand) and *Z. explanatus* sp. n. (New Zealand). The following synonymies are proposed: *Litargus* Erichson, 1846 (= *Catopius* Sharp, 1902) syn. n., *Litargus balteatus* LeConte, 1856 (= *Triphyllus minor* Lea, 1895) syn. n., *Mycetophagus confusus* Horn, 1878 (= *Triphyllus perfectus* Sharp, 1902) syn. n. The following new combinations are proposed: *Litargops intricatus* (Blackburn, 1891) (*Triphyllus*, *Litargus*) comb. n., *L. multiguttatus* (Lea, 1895) (*Triphyllus*, *Litargus*) comb. n., *Litargus irregularis* (Sharp) (*Catopius*) comb. n., *Mycetophagus (Paralitargus) didesmus* (Say) (*Litargus*) comb. n., *Neotriphyllus confusus* (Horn) (*Mycetophagus*) comb. n. *Nototriphyllus aciculatus* (Broun, 1880) (*Cryptophagus*) comb. n., *N. adspersus* (Broun, 1880) (*Cryptophagus*) comb. n., *N. constans* (Broun, 1914) comb. n., *N. fuliginosus* (Broun, 1880) (*Cryptophagus*) comb. n., *N. hispidellus* (Broun, 1880) (*Cryptophagus*) comb. n., *N. integritus* (Broun, 1893) comb. n., *N. pubescens* (Broun, 1909) comb. n., *N. madagascariensis* (Fairmaire, 1898) (*Triphyllus*) comb. n., *N. punctulatus* (Broun, 1880) (*Cryptophagus*) comb. n., *N. rubicundus* (Sharp, 1886) (*Triphyllus*) comb. n., *N. serratus* (Broun, 1880) (*Cryptophagus*) comb. n., *N. substriatus* (Broun, 1880) (*Cryptophagus*) comb. n. The larva of *Nototriphyllus araucania* is briefly described and compared with other known mycetophagid larvae. The genus *Nesolathrus* Scott (1922), described in Latridiidae and considered *incertae sedis* in Mycetophagidae by Lawrence & Newton (1995), is placed in the subfamily Bergininae, following Lawrence & Ślipiński (2013). The tribe Typhaeini Thomson (1863), as delimited by Nikitsky (1993), based on the lateral closure of the mesocoxal cavity by the mesoventrite and metaventrite, is considered to be non-monophyletic. *Rhipidonyx adustus* Reitter (1876), described in Mycetophagidae, is transferred to Tenebrionidae: Alleculinae, based on the description and examination of a specimen presumed to be the type.

Key words: *Afrotyphaeola*, Alleculinae, *Litargus*, *Litargops*, morphology, mycetophagy, *Neotriphyllus*, Notogean, *Nototriphyllus*, Tenebrionidae, *Zeclaviger*

Introduction

Mycetophagidae is a relatively small family containing less than 200 species currently placed in 18 genera (Nikitsky 1993, 2008; Lawrence & Leschen 2010). Most mycetophagids are fungus feeders, apart from species of *Berginus* Erichson, which feed on pollen or attack lac scale insects (Hemiptera: Coccoidea), and *Filicivora chilensis* (Philippi & Philippi), which feeds on fern spores (Imms & Chatterjee 1915; Lawrence 1991; Leschen & Lawrence 1991; Leschen 2000). The two largest genera, *Mycetophagus* Hellwig and *Litargus* Erichson, have been subdivided into subgenera based on the North American (Casey 1900; Parsons 1975) and Palaearctic (Vogt 1967; Nikitsky 1993) faunas, but the two systems have little in common, except perhaps the inclusion of the Holarctic *Mycetophagus quadriguttatus* Müller in the subgenus *Parilendus* Casey (Parsons 1975). Furthermore, the Pantropical and Notogean faunas have not been studied in detail. In Sharp's (1902) review of the Mesoamerican

Acknowledgments

The authors acknowledge CSIRO Ecosystem Sciences, Australia and Landcare Research, New Zealand for support of research and for allowing us to use copyrighted figures. Richard Leschen was supported in part by the Core funding for Crown Research Institutes from the Ministry of Business, Innovation and Employment's Science and Innovation Group. Steven Lingafelter hosted a visit to the NMNH, Smithsonian Institution by Hermes Escalona.

The following institutions and individuals are gratefully acknowledged for allowing us to study specimens in their care: Albert Allen, Boise, ID, USA; Australian National Insect Collection, CSIRO Ecosystems Science, Canberra, ACT, Australia; California Academy of Sciences, San Francisco, CA, USA (D. Kavanaugh); Canadian Museum of Nature, Ottawa, Ontario, Canada (R. Anderson, F. Génier); Field Museum of Natural History, Chicago, IL, USA (A. F. Newton, M. K. Thayer); Florida State Collection of Arthropods, Gainesville, FL, USA (P. E. Skelley); Landcare Research, New Zealand Arthropod Collection, Auckland, New Zealand; Museum I Instytut Zoologii, Polska Akademia Nauk, Warsaw, Poland (K. W. Tomaszewska); National Museum of Natural History, Smithsonian Institution, Washington, DC, USA (D. Furth, G. Hevel); The Natural History Museum, London, UK (M. Barclay); Snow Entomological Museum, University of Kansas, Lawrence, KS, USA (Z. Falin). Cate Lemann (ANIC) provided technical support.

The following artists are acknowledged for the following figures: D. Helmore (Figs 5I, 5M, 5O), S. P. Kim (Figs. 5A–B, 5N), S. Monteith (Fig. 5J). We are grateful to K. V. Makarov for allowing us to use the images in Figs. 1A–B, 1D–F, 1I–J, 1L, and to Chris Carlton and Paul Skelley for information on *Pseudotriphyllus*.
