Abstract

The primary types of Onciderini Thomson, 1860 deposited at The Natural History Museum (BMNH), London, United Kingdom, are catalogued and illustrated. Data on the original combination, current name, and type locality are verified and presented. There are 39 primary types of Onciderini including 11 in *Oncideres* Lacordaire, 1830; and three each in *Hesycha* Fairmaire & Germain, 1859; *Hypselomus* Perty, 1832; *Lamia* Fabricius, 1775; and *Tybalmia* Thomson, 1868. Of the 39 primary types, 17 were described by H. W. Bates and seven by F. P. Pascoe. Five lectotypes are designated. Notes on additional Onciderini types once believed to be deposited at the BMNH are presented.

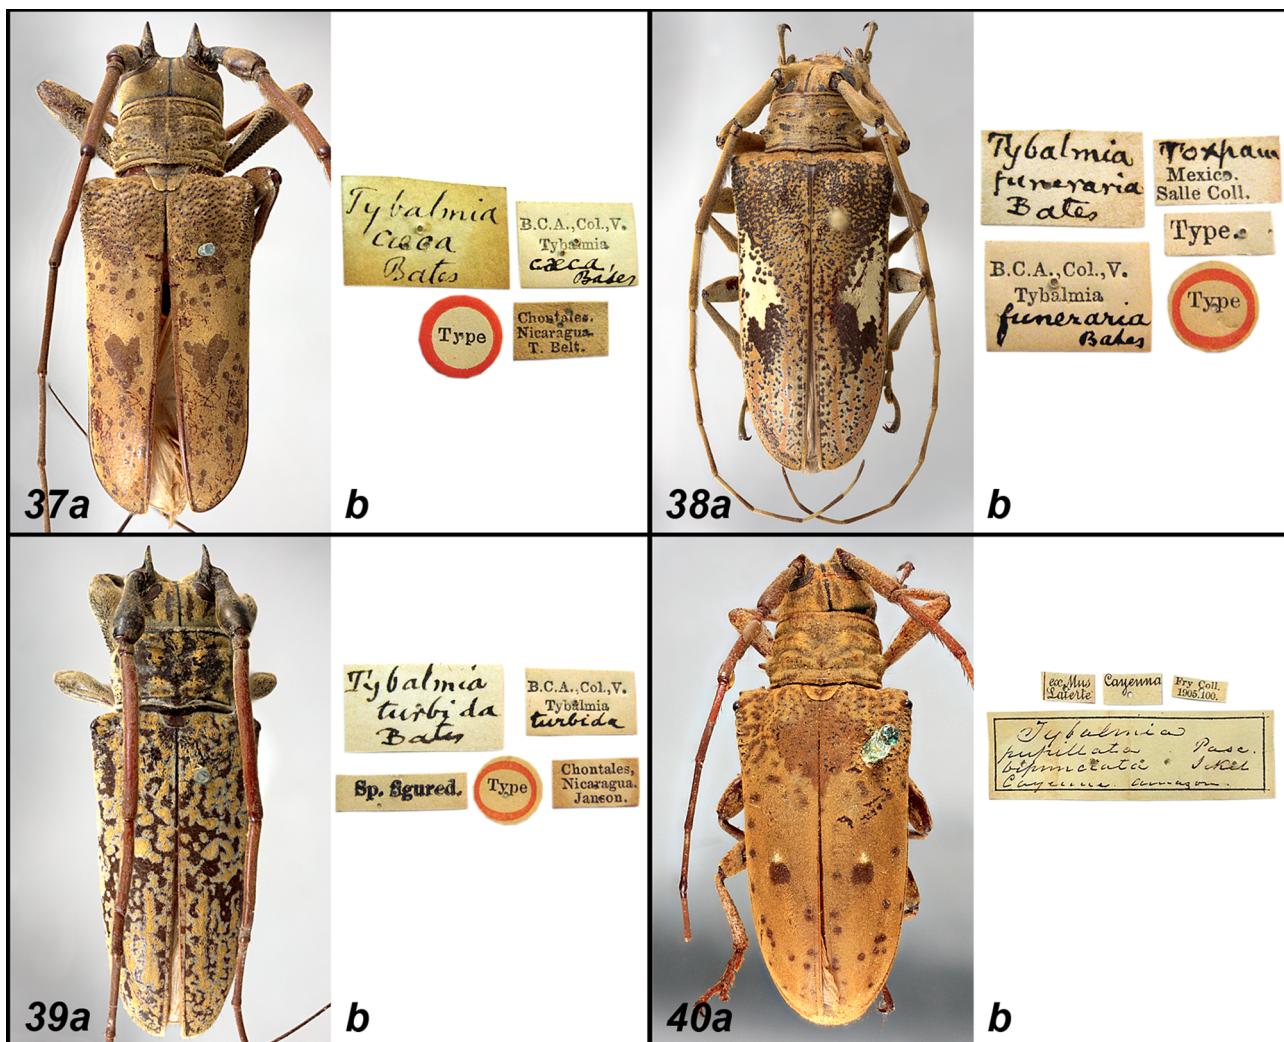

Key words: Catalog, holotypes, Neotropical, lectotypes

Introduction

The tribe Onciderini Thomson, 1860 (Cerambycidae: Lamiinae) is widely distributed in the New World from North America to southern South America (Monné 2005; Monné 2012; Bezark 2014; Tavakilian & Chevillotte 2014). Dillon & Dillon (1945, 1946) provided the only major revision of the tribe and Nearns & Swift (2011) provided a brief review of the taxonomic history of the tribe.

Recent work by Nearns *et al.* (2011), Nearns & Androw (2013), Nearns & Swift (2011), and Nearns & Tavakilian (2012a, 2012b, in preparation) has resulted in the photography of nearly all Onciderini primary type specimens. In this work, we present the 39 primary types of Onciderini deposited at The Natural History Museum (BMNH), most of which have never been published in color. Among these are 11 primary types in *Oncideres* Lacordaire, 1830, and three each in *Hesycha* Fairmaire & Germain, 1859; *Hypselomus* Perty, 1832; *Lamia* Fabricius, 1775; and *Tybalmia* Thomson, 1868. Seventeen of the primary types were described by Henry Walter Bates (1825–1892) and seven by Francis Polkinghorne Pascoe (1813–1893). In addition, five lectotypes are designated in order to stabilize the taxonomy and facilitate further identifications within this tribe. Notes on additional Onciderini types once believed to be deposited at the BMNH are also presented.

Nearly half (17) of the primary types of Onciderini at the BMNH were described by Henry Walter Bates. Born in Leicester, England, Bates and fellow explorer Alfred Russell Wallace (1823–1913) travelled to Brazil in 1848. Bates stayed in Amazonia 11 years, where he collected thousands of species new to science. Upon his return home, Bates published an account of his adventures which is now widely regarded as a classic: “The Naturalist on the Amazons” (1864). Bates published many important taxonomic papers, including “Contributions to an Insect Fauna of the Amazon Valley” (1865a, 1865b, 1865c, 1866) and the Cerambycidae volume of “Biologia Centrali-Americana” (1880, 1885).

Four species of Onciderini. **Fig. 37.** *Tybalmia caeca* Bates (a, dorsal habitus; b, labels). **Fig. 38.** *Tybalmia funeralaria* Bates (a, dorsal habitus; b, labels). **Fig. 39.** *Tybalmia turbida* Bates (a, dorsal habitus; b, labels). **Fig. 40.** *Hypsioma (Jamesia) bipunctata* Jekel (a, dorsal habitus; b, labels).

Acknowledgments

We greatly appreciate assistance from Roger Booth, Beulah Garner, and Michael Geiser (BMNH). We also thank Steven W. Lingafelter (Systematic Entomology Lab, National Museum of Natural History, Smithsonian Institution, Washington, DC, USA) provided helpful comments to a previous version of this manuscript. For funding and support of this research we thank Terrence W. Walters and Amanda J. Redford (U.S. Department of Agriculture / Animal and Plant Health Inspection Service), Kelly B. Miller (University of New Mexico, NM, USA) and Nathan P. Lord (Brigham Young University, Provo, UT, USA).
