Abstract

Thirty-five species of the genus *Houghia* Coquillett (Tachinidae, Exoristinae, Goniini) are described, 34 new and one previously described, all reared from various species of caterpillars collected in Area de Conservación Guanacaste (ACG), northwestern Costa Rica. A matrix of character states and a key for the identification of the species are also provided. By coupling morphology, life history and molecular data, with photographic documentation, a clear and concise description of each species is provided. The following 34 new species of *Houghia* are described, all authored by Fleming and Wood: *H. aerata* sp. nov., *H. aurifera* sp. nov., *H. biseriata* sp. nov., *H. bivittata* sp. nov., *H. blancoi* sp. nov., *H. brevipilosa* sp. nov., *H. chavarriae* sp. nov., *H. confinis* sp. nov., *H. delospilota* sp. nov., *H. destituta* sp. nov., *H. fimbriata* sp. nov., *H. gracilis* sp. nov., *H. graciloides* sp. nov., *H. griseifrons* sp. nov., *H. inflatipalpis* sp. nov., *H. latigena* sp. nov., *H. latilobus* sp. nov., *H. longicercus* sp. nov., *H. longipilosa* sp. nov., *H. luteiventris* sp. nov., *H. macilenta* sp. nov., *H. marini* sp. nov., *H. mattraitai* sp. nov., *H. nigrofemur* sp. nov., *H. ochrofemur* sp. nov., *H. omissa* sp. nov., *H. pallida* sp. nov., *H. parmata* sp. nov., *H. pilosifrons* sp. nov., *H. romeroae* sp. nov., *H. sexmaculata* sp. nov., *H. spathulata* sp. nov., *H. triangularis* sp. nov., and *H. velutina* sp. nov.

Key words: *Houghia*, Diptera, Tachinidae, Exoristinae, Gonini, tropical rain forest, tropical dry forest, parasitoid fly, host-specificity, caterpillars

Introduction

Area de Conservación Guanacaste (ACG) is a model of conservation effort through biodiversity development. As a result of the tireless efforts of its staff and collaborators, more than half a million wild-caught lepidopteran larvae have been reared for their parasitoids (Janzen et al. 2009, Janzen & Hallwachs 2011, Fernandez-Triana et al. 2014). This provides an unprecedented amount of data, providing invaluable information on parasitoid biology and associated hosts. The most speciose fly parasitoids encountered belong to the family Tachinidae.

The Neotropical Region has a tachinid fauna vastly more diverse than anything indicated in any publication. Although the number of named species catalogued by Guimarães (1971), some 2864 species, is larger than that of any other faunal region, this is undoubtedly a small fraction of what exists in nature, based on what has recently been discovered in Costa Rica, and what is already present in other collections. The most speciose elements of the fauna seem to occur in the upper elevations and cloud forests that extend from the western slopes of the Sierra Madre Occidentale in Mexico to both slopes of the Andes from Colombia south to Bolivia, and numerous species of *Houghia* have been found throughout this mountain chain.

The New World genus *Houghia* was erected by Coquillett (1897) for two specimens collected at Tifton,
Etymology. An adjective derived from the Latin noun “vellus”, meaning fleece, or wool when shorn off, referring to the velvety appearance of the sex patches.

Acknowledgments

We gratefully acknowledge the unflagging support of the team of ACG parataxonomists (Janzen et al 2009, Janzen & Hallwachs 2011) who found and reared the specimens used in this study, and the team of biodiversity managers who protect and manage the ACG forests that host these tachinids and their caterpillar hosts. The study has been supported by U.S. National Science Foundation grants BSR 9024770 and DEB 9306296, 9400829, 9705072, 0072730, 0515699, and grants from the Wege Foundation, International Conservation Fund of Canada, Jessie B. Cox Charitable Trust, Blue Moon Fund, Guanacaste Dry Forest Conservation Fund, Area de Conservación Guanacaste, Peruvian Global, and University of Pennsylvania (DHJ & WH). This study has been supported by the Government of Canada through its ongoing support of the Canadian National Collection, Genome Canada, the Biodiversity Institute of Ontario, and the Ontario Genomics Institute (2008-0GI-ICI-03) (MAS), and by a Discovery Grant from Natural Sciences and Engineering Research Council of Canada (MAS). The authors also wish to acknowledge the efforts and time of the editor and reviewers, who provided insights and suggestions allowing us to make our work better.
