Abstract

The Indonesian island of Sumatra contains several endemic species of parachuting frog of the genus *Rhacophorus*. Most of these are known from small type series collected from only a few localities, and consequently, many Sumatran *Rhacophorus* species are poorly understood. Using mitochondrial DNA (mtDNA), we investigated relationships among a group of *Rhacophorus* species from southern Sumatra. Our molecular analysis was based on a fragment of the 16S ribosomal subunit gene (16S) and included data derived from type specimens of two species endemic to Sumatra: *R. barisani* and *R. catamitus*. Our analyses of these data reveal that the only known female specimen of *R. catamitus* possesses a divergent 16S sequence compared to male specimens (8.82%; uncorrected “p” distance). Based on phylogenetic reconstructions, we found that this female specimen belongs to an unnamed taxon related to *R. margaritifer* from Java. Consequently, we remove the specimen from *R. catamitus* and describe it as *R. bengkuluensis* sp. nov., a medium-sized slender tree frog with extensive brown hand webbing. We identified additional specimens referable to the new species using mtDNA and morphology. These specimens originate from low to intermediate elevations (ca. 600–1600 m) in the provinces of Bengkulu and Lampung, suggesting that *R. bengkuluensis* is widely distributed across the southwestern versant of the Bukit Barisan.

Key words: Rhacophoridae, Indonesia, Sundaland, 16S, flying frog, new species, composite taxon

Introduction

The genus *Rhacophorus* (Anura: Rhacophoridae) is distributed throughout south-eastern Asia and currently contains 85 nominal species (Frost 2014). Members of the genus are foam-nest building tree frogs that occur from India and Sri Lanka, eastward to eastern China and Japan, and southward to the Philippines, Malaysia and Indonesia. Often referred to as parachuting frogs (Harvey *et al.* 2002), several species have extensive hand and foot webbing that they use for parachuting or gliding. Over 50% of the known parachuting frog species occur on landmasses of the Sunda Continental Shelf (Inger & Tan 1996; Iskandar & Colijn 2000; Harvey *et al.* 2002). Within this continental shelf, the Malay Peninsula and Borneo possess relatively well-studied assemblages of *Rhacophorus* (e.g., Inger 1966; Inger & Stuebing 1997; Malkmus *et al.* 2002; Dehling 2008; Hertwig *et al.* 2013). However, elsewhere in Sundaland parachuting frogs have been poorly examined (see Iskandar 1998; Harvey *et al.* 2002). In particular, the large Indonesian island of Sumatra has rarely been sampled and as such fewer amphibian species have been reported from this island than from neighbouring regions of the Sunda Shelf (Inger 1999). Sumatra is home to 10 *Rhacophorus* species, some with distributions extending outside of the island (*R. nigropalmatus*, *R. pardalis* and *R. prominanus*) and others that are thought to be endemic (*R. achantharrhena*, *R. barisani*, *R. bifasciatus*, *R. catamitus*, *R. modestus*, *R. poecilonotus*, and *R. pseudacutirostris*). A recently described

members (i.e., those that occur above 1000 m asl) of this assemblage (*R. barisani*, *R. bifasciatus*, *R. catamitus*, *R. modestus*, and *R. poecilonotus*) are known from the latitude of Padang southward. Thus, further study of inadequately sampled montane areas of northern Sumatra should yield many new species belonging to this charismatic genus of tree frogs.

Acknowledgements

We are grateful to the Ministry of Research and Technology of the Republic of Indonesia, particularly Mr. S. Wahyono, for coordinating and granting our research permissions (149/SIP/FRP/SM/V/2013; 149-A/SIP/FRP/SM/XII/2013). We thank past and present representatives of LIPI at the Museum Zoologicum Bogoriense for facilitating the study of specimens and field and export research permits, namely Boadi, M. Amir, H. Kurniati, R. Ubaidillah, I. Sidik, and R. M. Marwoto. W. Trilaksono, I. Sidik, and A. Ryanto kindly provided laboratory assistance at MZB. Doctor Widodo and Dr. Marwoto from the Faculty of Mathematicas and Natural Sciences of Universitas Brawijaya (MIPA-UB) kindly provided logistical support. The Forestry Department of Indonesia kindly provided research permits for areas under their jurisdiction, Kerinci Seblat NP (Sungai Penuh), Bukit Barisan Selatan NP (Kabu Perahu, Kota Agung). Molecular work was supported by startup funds awarded to ENS from UTA. For their field efforts, we thank members of the summer 2013 expedition to southern Sumatra: G. Barraza (Broward College); U. Arifin (Institut Teknologi Bandung), W. Trilaksono (MZB); C. Franklin, K. O'Connell, U. Smart, E. Wostl (UTA), and A. M. Kadafi, D. R. Wulandari, R. Darmawan, K. I. Nawie, A. Dharasa, and S. Pratassi (MIPA- UB); we also thank A. Ul-Hasanah, Andiek F., and Nurrohim for collecting specimens of the new species. Specimens examined in the United States were exported with MZB permits to MBH and ENS (ref. # 14/SI/MZB/VI/1996; 31/SI/MZB/VII/2013; 12/SI/MZB/II/2014). Trips to examine material and deposit type specimens in Indonesia were aided by National Science Foundation sponsored projects DEB-1146324 (ENS and MBH) and OISE-1209793 (JWS).
