Abstract

A new species of the alvinocaridid shrimp genus *Alvinocaris* Williams & Chace, 1982 is described from the Solitaire hydrothermal vent field at 2606 m depth on the Central Indian Ridge. *Alvinocaris solitaire* sp. nov., the first species of the genus to be recorded from the Indian Ocean, is morphologically most similar to *A. lusca* Williams & Chace, 1982 from the Galapagos Rift, East Pacific Rise. The new species is distinguished from *A. lusca* by the less produced pterygostomial angle of the carapace, the presence of small teeth on the posterolateral margin of the third pleuron, and the lack of short plumose setae on the posteromedian margin of the telson. The genetic divergence of the mitochondrial cytochrome *c* oxidase subunit I (COI) gene (600 bp) among the nine *Alvinocaris* species analyzed clearly indicates that the new taxon is distinct from the congeneric species for which genetic data are available.

Key words: *Alvinocaris solitaire*, Solitaire hydrothermal vent field, Central Indian Ridge, YK13-02 cruise

Introduction

Since the discovery of hydrothermal activity on the Central Indian Ridge, Indian Ocean, in 2000 (Hashimoto et al. 2001), several new species of decapod crustaceans have been described, viz., *Rimicaris kairei* Watabe & Hashimoto, 2002 and *Mirocaris indica* Komai, Martin, Zala, Tsuchida & Hashimoto, 2006 (Caridea: Alvinocarididae), *Munidopsis laticorpus* Cubelio, Tsuchida & Watanabe, 2008 (Anomura: Munidopsidae), and *Austinograea rodriquezensis* Tsuchida & Hashimoto, 2002 (Brachyura: Bythograeidae). During the research project “Quest for the Limit of Life (QUELLE) 2013” by the Japan Agency for Marine-Earth Science and Technology (JAMSTEC), the chemosynthetic assemblages of the recently discovered Dodo and Solitaire hydrothermal vent fields on the Central Indian Ridge (Nakamura et al. 2012) were investigated. Among the

Habitat and associated species. The present specimen was collected in an assemblage of white predatory gastropods of the genus *Phymorhynchus*, which is distributed in the periphery of an actively venting area in the Solitaire hydrothermal vent field. The alvinocaridid shrimp *Mirocaris indica* and some species of polychaetes (e.g. *Archinome* sp.) and limpets (e.g. *Eulepetopsis* sp.) were collected with *A. solitaire* sp. nov.

Etymology. Named after the type locality, Solitaire hydrothermal vent field; used as noun in apposition. The name of the hydrothermal vent field, “Solitaire”, was derived from an extinct species of an endemic bird (Rodriguez solitaire, *Pezophaps solitaria*) inhabiting Rodriguez Island (Nakamura et al. 2012).

Acknowledgements

The holotype of the present new species was obtained during the around-the-world voyage by RV “Yokosuka”, QUELLE 2013, conducted by JAMSTEC. We are thankful to Drs. Daniel P. Marie, Vishwakalyan Bhoyroo and Dass Bissessur, Ms. Modoosoodun Khishma (Mauritius Oceanography Institute), and Mr. Sanjeev Lecraz (Ministry of Agro Industry and Food Security) for sampling the specimen, and Drs. Ken Takai and Manabu Nishizawa (JAMSTEC), for managing the YK13-02 cruise with HW. We would like to express our sincere appreciation to the captain, officers, and crews of the RV “Yokosuka” and HOV “Shinkai 6500” for their technical support. We are deeply grateful to Dr. Verity Nye (University of Southampton) for providing valuable comments on an earlier draft.
