

## Revision of the Palaearctic and Oriental species of the genus *Naarda* Walker, 1866 (Lepidoptera: Erebidae, Hypeninae).

### Part 5. Description of 13 new species from Asia

### Abstract

Descriptions of 13 new *Naarda* species, *N. cingulata* (Thailand), *N. imitata* (Cambodia), *N. hallasana* (Korea), *N. calligrapha* (India, Burma and Indonesia: Buru Island), *N. felinopsis* (Vietnam), *N. furcipalpa* (Brunei), *N. uthanti* (Burma), *N. capreola* (Cambodia), *N. leptosigna* (Sri Lanka), *N. nigrissima* (Cambodia, Thailand and Taiwan), *N. bicolora* (Cambodia), *N. gigaloba* (Sri Lanka) and *N. numismata* (India) spp. n. are given. With 50 figures.

**Key words:** *Naarda*, Hypeninae, new species, Asia, description, genitalia, labial palps

### Introduction

With the publication of this part the number of *Naarda* species described by the authors as new for the science rises to 63 and the total number of Oriental and Palaearctic taxa exceeds the 90. In contrast to the previous four parts (Tóth & Ronkay, 2014a; in press: b; 2015a and b), which deal with more or less distinct and compact evolutionary lineages, this paper contains the descriptions of a dozen of species from different internal groups. This article presents largely the results of the first author's research in The Natural History Museum, London, and the results of the study of hitherto unidentified material of the Hungarian Natural History Museum, Budapest.

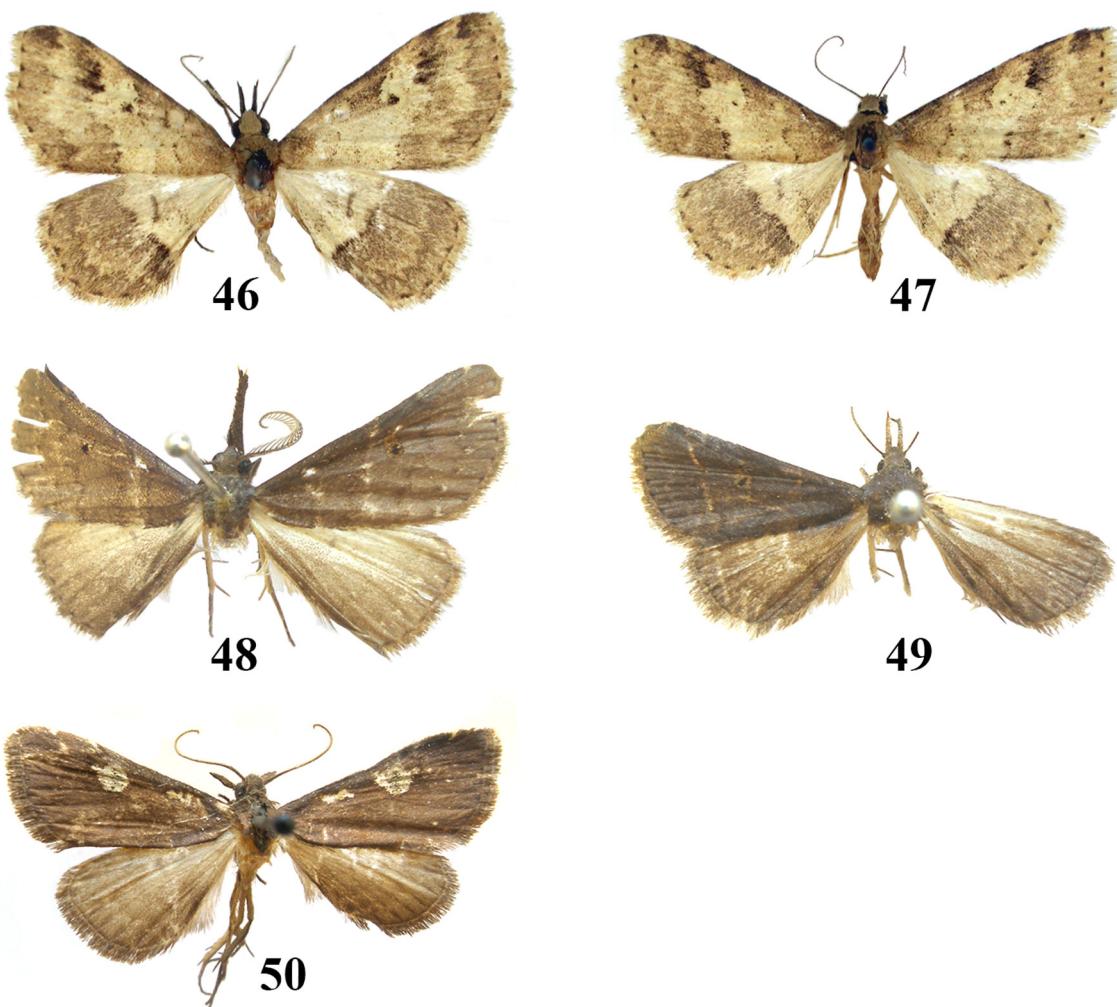

Literature sources include, besides the recent works of the authors, practically only the original descriptions of the species given by Walker (1858, 1859, 1866), Hampson (1891, 1893, 1902, 1912), Staudinger (1892), Wileman (1915), Strand (1920), Prout (1928), de Joannis (1929), Sugi (1982), Holloway (2008) and Deng & Han (2011).

According to our plans, this is the last part containing only descriptions; the next item will enumerate all Asian species and establish the infrageneric systematics of the group.

### Material and methods

The method of preparing permanent genitalia slides, the genitalia terminology and the structure of species descriptions are the same as in the first part of this series. We continue the practice of designating the least worn male specimen as holotype in each description.
