Abstract. Currently, 16 species of Flabelligeridae have been recorded in Brazil, four in the genus *Diplocirrus*: *D. glaucus* Malmgren, 1867 from Ubatuba, *D. capensis* Day, 1961 from Santos (São Paulo State) and *Diplocirrus* sp. from off north of Rio de Janeiro. *Diplocirrus glaucus australis* Nonato, 1981 is considered a nomen nudum. In the present study, three new species are described: *Diplocirrus rugosus* sp. nov., *Diplocirrus salazarvallejoi* sp. nov. and *Diplocirrus acafi* sp. nov., all collected from soft bottoms off southeast Brazil. A key to all *Diplocirrus* species is provided.

Key words: Annelida, polychaetes, morphology, taxonomy, Habitats Project

Introduction

*Diplocirrus* is a genus of the Flabelligeridae family proposed by Haase (1915) following earlier observations by von Marenzeller (1889) and de Saint-Joseph (1898). The genus is characterized by abundant clavate or subcylindrical (often anteriorly swollen) body papillae, all chaetae multiarticulated capillaries, thick neurochaetae, and sessile branchiae. Although both branchial and chaetal features are employed to distinguish flabelligerid genera, their delineation is sometimes unclear because branchial features are in the eversible anterior end, which is rarely exposed (Salazar-Vallejo & Buzhinskaja 2011).

In Brazil, Petti (1997) and Paiva (1990, 1993) recorded *Diplocirrus glaucus* (Malmgren, 1867) in Ubatuba, *D. capensis* Day, 1961 from Santos (São Paulo State) and *Diplocirrus* sp. from off north of Rio de Janeiro. *Diplocirrus glaucus australis* Nonato, 1981 is considered a nomen nudum. In the present study, three new species are described: *Diplocirrus rugosus* sp. nov., *Diplocirrus salazarvallejoi* sp. nov. and *Diplocirrus acafi* sp. nov., all collected from soft bottoms off southeast Brazil. A key to all *Diplocirrus* species is provided.

Material and methods

Material was collected during two sampling campaigns during the Habitats/Petrobras – Campos Basin Environmental Heterogeneity Project, coordinated by CENPES/Petrobras. All necessary permits for the described field studies were obtained prior the beginning of the sampling. Sampling was authorized and conditioned by environmental licenses (Prior Licenses no. 284 2008 and Operation no. 782 2008) issued by the Brazilian Environmental Agency (IBAMA).
