Abstract

Nine species of the subgenus *Albuginosus*, one species of the subgenus *Aedimorphus* Grjebinei Group and two species of the subgenus *Aedimorphus* Apicoannulatus Group of the genus *Aedes* Meigen in the Afrotropical Region are treated in three pictorial keys based on diagnostic morphological features.

Key words: Culicidae, mosquitoes, identification key, Africa

Introduction

Precise and simple keys are essential tools for the accurate identification of species of mosquitoes, and correct identifications are necessary for the management and control of vector species, including prevention of epidemics of infectious diseases. The purpose of this paper is to provide pictorial keys to species of the subgenera *Albuginosus* and *Aedimorphus* (Grjebinei and Apicoannulatus Groups), and thus, to facilitate their accurate identification.

Edwards (1941) divided the genus *Aedes* Meigen into nine subgenera in his “Mosquitoes of the Ethiopian Region”. Reinert (1987) removed *Aedes marshallii* (Theobald) from the Apicoannulatus Group of the subgenus *Aedimorphus* Theobald and defined a new subgenus, *Albuginosus*, for that species and its relatives. Reinert included nine species, previously assigned to the subgenus *Aedimorphus*, in *Albuginosus*. Reinert (1987: 307) noted in the introduction that “Adults of *Ae. grjebinei* also were not available for examination, but there is no doubt this species should be included in *Albuginosus* based on the information provided in the original description.” After a critical study of all known specimens, it is apparent that *Ae. grjebinei* should not be included in the subgenus *Albuginosus* because it bears thoracic characters of *Aedimorphus*, and we hereby assign it to its own group (Grjebinei) within *Aedimorphus*.

To assist entomologists and other field workers in the identification of mosquitoes from Africa and to clarify the taxonomic status of *Ae. grjebinei*, we provide three pictorial keys as add-ons to the keys of Huang (2001). A few additional characters, indicated by double asterisks (**), were added as needed to facilitate identification. Images of diagnostic morphological structures of the adult head, thorax, legs and wing are also included in the supplemental pictorial keys.

Material and methods

This study is based on specimens in the mosquito collection of the Department of Entomology, National Museum
of Natural History (USNM), Smithsonian Institution. Other specimens were borrowed from the individuals and institutions noted in the acknowledgments. The terminology follows Harbach and Knight (1980, 1982) with the exception of “tarsal claws,” which is retained for “ungues.” Terminology for wing venation follows Belkin (1962).

In this paper, we follow Edwards’ (1932) classification of the genus *Aedes*, retaining both *Albuginosus* and *Aedimorphus* as subgenera of the genus *Aedes*.

**Result and Discussion**

Huang (2001) published a key to the *Aedes* mosquitoes of the Afrotropical Region. This paper is openly available from the websites of the Biodiversity Heritage Library (http://www.biodiversitylibrary.org/) and Walter Reed Biosystematics Unit (http://wrbu.si.edu/wrbupubs_chron.html). It includes pictorial keys for *Aedes (Albuginosus)* (Appendix 1), the *Aedes (Aedimorphus)* Grjebinei Group (Appendix 2), and the *Aedes (Aedimorphus)* Apicanoannulus Group (Appendix 3) in the Afrotropical Region. These keys are formatted so they can be merged with the keys of Huang (2001). The following steps should be followed when using the key of Huang (2001) to merge the supplemental keys:

(1) A Pictorial Key to the Species of the *Aedes (Albuginosus)* in the Afrotropical Region (Diptera: Culicidae) (Appendix 1). From Page 34 of Huang (2001) key, with “Part 3. Key to Subgenera of *Aedes*”, ADULTS, follow the key to Page 35, then to Page 40, to Page 42b, to Page 43 (on the left side – Thorax. Subspiracular area with scales, and ** Head. Pedicel with a patch of white broad overlapping scales on mesal surface), to key out to *Albuginosus*. Using Appendix 1, the supplemental key, add Page 43A (1\textsuperscript{st} page), Page 43B (2\textsuperscript{nd} page), Page 43C (3\textsuperscript{rd} page), Page 43D (4\textsuperscript{th} page A and 4\textsuperscript{th} page B), Page 43E (5\textsuperscript{th} page A and 5\textsuperscript{th} page B), to key out to *Aedes (Albuginosus)*, for nine species.

(2) A Pictorial Key to the Species of the *Aedes (Aedimorphus)* Grjebinei Group in the Afrotropical Region (Diptera: Culicidae) (Appendix 2). From Page 34 of Huang (2001) key, with “Part 3. Key to Subgenera of *Aedes*”, ADULTS, follow the key to Page 35, to Page 40, to Page 42b, to Page 43, then (on the right side, replace with Page 43A (1\textsuperscript{st} page) - Thorax. Subspiracular area without scales, and ** Head. Pedicel with a patch of white broad overlapping scales on mesal surface), and to Page 43 B (2\textsuperscript{nd} page), to key out to Grjebinei Group. Using Appendix 2, the supplemental key, add Page 43A (1\textsuperscript{st} page), Page 43B (2\textsuperscript{nd} page), to key out to *Aedes (Aedimorphus) Grjebinei Group*, for one species.

(3) A Pictorial Key to the Species of the *Aedes (Aedimorphus)* Apicoannulus Group in the Afrotropical Region (Diptera: Culicidae) (Appendix 3). From Page 34 of Huang (2001) key, with “Part 3. Key to Subgenera of *Aedes*”, ADULTS, follow the key to Page 35, then to Page 40, to Page 42b, to Page 44b (Thorax. Subspiracular area without scales), to Page 46b, to Page 47a (** Head. Pedicel with few setae and scales on mesal surface), to key out to *Apicoannulus Group*. Using Appendix 3, the supplemental key, add Page 47A (1\textsuperscript{st} page), to key out to *Aedes (Aedimorphus) Apicoannulus Group*, for two species.

The subgenus *Albuginosus* is characterized by having the subspiracular area with scales, and pedicel with a patch of white broad overlapping scales on mesal surface. It is represented by nine species: (1) *Ae. (Alb.) capensis* Edwards, 1924, (2) *Ae. (Alb.) gilliesi* Van Someren, 1962, (3) *Ae. (Alb.) haworthi* Edwards, 1923, (4) *Ae. (Alb.) kapretwae* Edwards, 1941, (5) *Ae. (Alb.) kennethi* Muspratt, 1956, (6) *Ae. (Alb.) marshallii* (Theobald, 1901), (7) *Ae. (Alb.) ngong* Van Someren, 1950, (8) *Ae. (Alb.) stokesi* Evans, 1929, and (9) *Ae. (Alb.) teesdalei* Van Someren, 1954. The *Aedes (Aedimorphus)* Grjebinei Group is briefly characterized by having the subspiracular area without scales, and pedicel with a patch of white broad overlapping scales on mesal surface. It is represented by only one species: *Ae. (Aed.) grjebinei* Hamon, Taufflieb & Maillot, 1957. The *Aedes (Aedimorphus) Apicoannulus Group* is characterized by having the subspiracular area without scales, and pedicel with few setae and scales on mesal surface. It is represented by two species: *Ae. (Aed.) apicoannulus* (Edwards, 1912), and *Ae. (Aed.) simulans* (Newstead and Carter, 1911).

**Remarks**

Reinert et al. (2009) placed these two species of the *Aedes (Aedimorphus) Apicoannulus Group* in their new
genus, *Elpeytonius* Reinert, Harbach & Kitching, 2009. Although Reinert *et al.* (2004, 2006, 2008, 2009) substantially revised the classification of the tribe Aedini, and some of their conclusions are warranted, we do not fully accept herein their classification because their results were based on partial treatments of several groups. Consequently, a large number of species remains without subgeneric placement. Thus, the new reclassification of the genus *Aedes* proposed by Reinert *et al.* (2004, 2006, 2008, 2009) is incomplete and needs comprehensive taxonomic analysis (Huang and Rueda 2014).

**Medical Importance**

Brottes *et al.* (1966) isolated the Bunyamwera Virus from a mixed pool of *Ae. capensis, Ae. kummi* Edwards, *Ae. mutilus* Edwards, *Ae. simulans*, and *Ae. tarsalis* group of species in Cameroun. Berge (1975) isolated the Middleburg Virus from *Ae. marshallii* in Natal, South Africa. *Aedes stokesi* was considered to be a potential vector of Yellow Fever Virus in the Ivory Coast (Cordellier and Geoffroy 1974), in the lowlands of Arba-Minch District of Ethiopia (Ardoin *et al.* 1976), and in Senegal (Cornet *et al.* 1978).

**Acknowledgments**

We express sincere appreciation and gratitude to Mr. Scott D. Whittaker, Manager SEM Laboratory, National Museum of Natural History, Smithsonian Institution, for access to and assistance with Imaging-Digital Instrument (Olympus SZX- 12 MDU) while conducting this study; to Dr. Wayne N. Mathis, Department of Entomology, Smithsonian Institution, Dr. Richard C. Wilkerson, Walter Reed Biosystematics Unit (WRBU), Prof. Maria Anice Mureb Sallum, University of Sao Paulo, Sao Paulo, Brazil, and three anonymous reviewers for critically reviewing this manuscript, and for their valuable comments; to Dr. Raymond J. Gagne, Research Entomologist, Systematics Entomology Laboratory, U. S. Department of Agriculture, for translating into English publications written in French.

We are most grateful to Miss Theresa M. Howard, Head of Entomological Collections, Molecular Collections, and Plants, Department of Life Sciences, The Natural History Museum, London, UK, for the loan of several types and other specimens. We also acknowledge with sincere appreciation the following: Prof. Maureen Coetzee, Vector Control Reference Unit, National Institute for Communicable Diseases (VCRU/NICD), Johannesburg, South Africa, for the loan of types and other specimens; Mr. Nil Rahola, Dr. Gilbert Le Goff and Dr. Philippe Bousses, Institut de Recherché pour le Developpement (IRD), Montpellier, France, for the loan of the type specimens of *Ae. (Adm.) grjebinei* and other specimens.

This research was performed under a Memorandum of Understanding between the Walter Reed Army Institute of Research and the Smithsonian Institution, with institutional support provided by both organizations. The text and graphics published herein reflect the views of the authors and should not be construed to represent those of the Department of the Army or the Department of Defense.
