⁴Author for correspondence

New synonym in *Anastrophyllum nigrescens*

Anastrophyllum paramicola was described by Schuster (2002a) as being remotely allied to *Anastrophyllum donnianum* (Hooker 1813: 39) Stephani (1893: 140) and *Anastrophyllum assimile* (Mitten 1860: 93) Stephani (1893: 140). However, Schuster did not at all mention the relatively common *Anastrophyllum nigrescens* and the description match that species well.

New synonyms in *Anastrophyllum auritum*

Anastrophyllum auritum is a very variable species, which has resulted complicates its taxonomy. The problem is insufficient knowledge of the extreme variability in the branching patterns, size of plants, leaf insertion etc., which also has influenced the infrageneric (especially sectional) classification of the genus *Anastrophyllum* (Spruce 1876: 235) Stephani (1893: 139) proposed by Schuster (1969, 2002a). Some populations of this species from localities with extreme severe conditions (most of subantarctic populations, including the type of *Anastrophyllum auritum* from Table Mt., populations from highest elevations in Andes etc.) are very small plants with mostly only terminal branches, sometimes also with ventral-lateral branching producing stolons, pectinately arranged leaves, small (reduced to small teeth or slime papilla) or missing appendages, dorsal part of leaves extended only slightly or not across the stem and nearly not decurrent dorsal leaf bases. However, optimally developed plants of *Anastrophyllum auritum*, relatively common in high mountains of tropical region (Andes, eastern Brazil, central African mountains, Sumatra, Borneo and New Guinea), but also found in the subantarctic area (e.g. Crozet Is., Massé P 69/a, JE), and described under many names, are large plants with mostly only lateral-intercalary branches, large appendages on the dorsal base of leaves, long decurrent dorsal leaf bases etc. Such optimally developed plants show variability in leaf lobes and sinuses; leaf lobes can be widely ovate to narrowly triangular, with apices subobtuse, subapiculate, mucronulate to apiculate with 1-3-celled uniseriate apex (cf. *Anastrophyllum leucocephalum*, *Anastrophyllum cuspidatum*, etc.], entire or crenulate margins, sinus can be narrowly or widely acute.

Schuster probably never examined the type specimen of *Anastrophyllum auritum* (like many taxa described from Africa). He first mentioned this name (in Schuster 2002a) in connection with the studies of Váňa (1975, 1980, 1982, 1984) and his experience of this species is mostly based on the study of well developed plants from Venezuela. He did not recognize the presence of terminal branching (*Frullania*-type) in Venezuelan specimens identified as *Anastrophyllum auritum*. On the other hand he mentioned this type of branching in *Anastrophyllum leucostomum* (cf. Schuster 1966b: 747), which he compared with *Anastrophyllum sphenoloboides* Schuster (1969: 741). However, the identity of *Anastrophyllum leucostomum* and *Anastrophyllum auritum*, published by Váňa (1984), was overlooked by Schuster (2002a).

Small subantarctic populations were described by Schuster (1966a: 282) as *Anastrophyllops novazelandiae* on the basis of the material “occurred in very small quantity”. This species was characterised by small plants with terminal *Frullania*-type branching, leaf margins “distinctly and diagnostically crenulate”, dorsal leaf base “sometimes with a stalked slime papilla or small tooth” (see also Schuster 1966a, fig 4: 2 and 6) etc. At almost the same time the same author briefly described, in a footnote, *Anastrophyllops crenulatum* from Argentina. Its main diagnostic character was said to be crenulate leaves. He created the new section, *Anastrophyllops* sect. *Crenulatae* Schuster (1969: 740) for this species, *Anastrophyllops novazelandiae* and *Anastrophyllops pusillum* Stephani (1917: 108). These species were first compared in Schuster (2002a). The differences between *Anastrophyllops crenulatum* (+ *Anastrophyllops pusillum*) and *Anastrophyllops novazelandiae* (based from description and key) are the absence of lateral intercalary branches in *Anastrophyllops novazelandiae* and the leaf lobes (acute, ± longer than broad in *Anastrophyllops novazelandiae*; blunt to subacute, as broad as long in *Anastrophyllops crenulatum* and *Anastrophyllops pusillum*). It should be mentioned that in the original diagnosis of *Anastrophyllops crenulatum* the leaf lobes are described as “lobis ... acutis”. However, in the drawing of the species in Schuster (2002a: fig. 327A) there are also leaves with basal appendages (not mentioned by Schuster; cf. fig. no. 1 and 12). Moreover, Schuster (2002a) accepted the occurrence of *Anastrophyllops auritum* in Marion I. and Crozet Is., probably on the basis of reports in Grolle (1971a, 1971b) or Váňa (1975, 1982).

The types of *Anastrophyllops novazelandiae* and *Anastrophyllops crenulatum* could not be studied but the specimen Child H4313 (F), identified as *Anastrophyllops novazelandiae* (cf. Engel & Braggins 1998) was examined, and it agrees completely with *Anastrophyllops auritum*.

It should be added that:

- a) Small plants, but with not markedly crenulate leaves from Mexico were described as *Jungermannia intricata* and once more as *Anastrophyllops gottscheanum*. The latter species was compared with *Anastrophyllops michauxii* (Weber 1815: 76) Buch (1933: 289) and found to be different.
- b) The type of *Anastrophyllops pusillum* was never examined by Schuster (cf. Schuster 2002: 308); this species is synonymous with *A. tubulosum* (Nees 1830: 32) Grolle (1965: 101)!
- c) The section *Anastrophyllops* sect. *Crenulatae*, like some other described sections (sect. *Hypocladopsis* Schuster (2002a: 315, *nom. inval.*), sect. *Revolutae* Schuster (2002a: 313, *nom. inval.*) etc.) is of problematical taxonomic value; scattered molecular data about the genus *Anastrophyllops* also shows that Schuster’s infrageneric concept can not stand and it is shown that at least *Sphenolobus* (Lindberg 1874: 369) Berggren (1898: 22) should be re-established as a separate genus (De Roo et al. 2007).
- d) Small plants of *Anastrophyllops auritum* collected by Schuster in Venezuela, Est. Mérida (together with ‘true’ *Anastrophyllops auritum* s.str.!) were named and figured as *Anastrophyllops intermedium* and compared with *Anastrophyllops minutum* (Crantz 1770: 285) Schuster (1949: 576) [= *Sphenolobus minutus* (Crantz 1770: 285) Berggren (1898: 22)] but separated on the basis of lacking gemmae.
- e) Small plants with long acuminate leaf lobe tips and with ventral-lateral branching, also collected by Schuster in Venezuela, Estado Tachira, were described as *Anastrophyllops hypocladopsis* and the new section *Anastrophyllops* sect. *Hypocladopsis* was described for this species.
- f) *Anastrophyllops* sect. *Anastrophyllopsis* Schuster (2002a: 294), which recently was elevated to the genus level (Váňa et al. 2012), was established for “larger taxa, with the dorsal end of the leaf insertion inclined toward the shoot apex”. Based on this character only (!) some plants of *Anastrophyllops auritum* may belong to this “section”.
- g) Small plants without gemmae were also mentioned from New Zealand as *Anastrophyllops ambiguum* and compared with *A. austroamericanum* which, according to Schuster (2002a: 305) should be gemmiparous, but according to the information in the key and in the text (l.c.: 298, 303) “gemmae are lacking”. In the original description (Váňa 1980: 225) it is stated “gemmae not observed”. Engel & Glenny (2008) did not mention the name *Anastrophyllops ambiguum* at all.

h) Engel & Braggins (1998) did not refer to the existence of *Anastrophylleum crenulatum*, and this species was also not mentioned in Engel & Glenny (2008). In both studies only *Anastrophylleum novazelandiae* is accepted for New Zealand plants.

Transfer of *Anastrophylleum austroamericanum* to *Sphenolobus*

De Roo *et al.* (2007) showed that *Sphenolobus* is a genus that should be segregated from *Anastrophylleum*. Two species, *Sphenolobus minutus* and *Sphenolobus saxicola* (Schrader 1797: 97) Stephani (1902a: 168) were included in the study. Recently *Sphenolobus ellipticus* (Inoue 1978: 13) Katagiri & Furuki (2012: 206) was transferred from *Anastrophylleum*. One more species, *Anastrophylleum austroamericanum*, remains to be transferred. It is a species morphologically close to *Sphenolobus minutus* but differs in the reddish-brown coloration, presence of intercalary branching (*Bazzania*-type), somewhat oblique (not transverse) leaf insertion, presence of small trigones in leaf cells, typical “*Anastrophylleum*” decolorate perianth mouth.

New combination and synonyms in *Plicanthus*

Plicanthus Schuster (2002b: 484) was separated from *Chandonanthus* Mitten (1867: 750) by Schuster (2002b) who assigned four species to it, leaving *Chandonanthus* monotypic. *Plicanthus hirtellus* (Weber 1815: 50) Schuster (2002b: 492) is a variable taxon and most characters used to separate taxa are quantitative rather than qualitative. Kitagawa (1981) regarded *Chandonanthus hamatus* Stephani (1908: 643) as a synonym to *Chandonanthus hirtellus* (Weber 1815: 50) Mitten (1867: 750) but Schuster (2002b) recognized it as *Plicanthus hamatus* (Stephani 1908: 643) Schuster (2002b: 494). However, several taxa in *Chandonanthus* have never been restudied and their placement thus unclear. A few of them have been available for us to study.

Formal treatment

The format of this note follows what is outlined in Söderström *et al.* (2012).

***Anastrophylleum nigrescens* (Mitt.) Steph., *Hedwigia* 32: 140, 1893 (Stephani 1893).**

Basionym:—*Jungermannia nigrescens* Mitt., *Hooker's J. Bot. Kew Gard. Misc.* 3: 358, 1851 (Mitten 1851).

= *Anastrophylleum paramicola* R.M.Schust., *Beih. Nova Hedwigia* 119: 316, 2002 (Schuster 2002a), *syn. nov.*
Type:—ECUADOR. Hyperpáramo, crest of road from Pifo to Papallacta, R.M. Schuster RMS 93-220 (holotype F, non *vidi*).

***Anastrophylleum auritum* (Lehm.) Steph., *Bull. Herb. Boissier ser. 2* 1: 1137 (*Spec. Hepat. [Stephani]* 2: 120), 1901 (Stephani 1901).**

Basionym:—*Jungermannia aurita* Lehm., *Linnaea* 4: 368, 1829 (Lehmann 1829).

Type:—SOUTH AFRICA. Table Mt., Ecklon (holotype S!, isotypes H-SOL!, W-Lindenb. Hep. 250!).

≡ *Sarcocyphos auritus* (Lehm.) Nees, *Syn. Hepat.* 1: 9, 1844 (Gottsche *et al.* 1844)
≡ *Nardia aurita* (Lehm.) Trevis., *Mem. Reale Ist. Lombardo Sci., Ser. 3, C. Sci. Mat.* 4: 401, 1877 (Trevisan 1877)
≡ *Marsupella aurita* (Lehm.) Sim, *Trans. Roy. Soc. South Africa* 15: 112, 1926 (Sim 1926).
= *Jungermannia crebrifolia* Hook.f. et Taylor, *London J. Bot.* 3: 467, 1844 (Hooker & Taylor 1844), *syn. fide* Váňa in Gradstein & Costa (2003). Lectotype:—CHILE. Prov. Magallanes: Cabo de Hornos (= Cape Horn), 1843, *Hooker* (Voyage of H. M. S. Erebus & Terror) (FH!, isolectotypes BM!, G-121797! [=G-17223!]¹, NY!, S!, W-Lindenb. Hep. 1627!) ≡ *Anastrophylleum crebrifolium* (Hook.f. et Taylor) Steph., *Hedwigia* 32: 140, 1893 (Stephani 1893).

1. Citation of specimens in G should preferably use the barcode (M. Price, pers. comm.) but for comparability the numbers printed on the specimen, which have often been cited by previous authors, are also given here in square brackets. In case the barcode number is missing, the older number is still given within square brackets.

- = *Jungermannia leucocephala* Taylor ex Lehm., *Nov. Stirp. Pug.* 8: 8, 1844 (Lehmann 1844), syn. of *A. crebrifolium* fide Engel (1978). Type:—BRAZIL. ad confines Rio de Janeiro–Minas Geraës, in rupestribus montis Itatiaya, locis umbrosis humidis, 1300-2750 m, 18. September 1901, *Schiffner* 437 (holotype W!).
- = *Anastrophyllum gottscheanum* R.M.Schust., *Rev. Bryol. Lichénol.* 34: 270, 1966 (Schuster 1966a), *syn. nov.* Type:—MEXICO. Pico de Orizaba, *Liebmam* (ex Herb. Gottsche) (holotype G-113582* [=G-17238!]).
- = *Anastrophyllum novazelandiae* R.M.Schust., *Rev. Bryol. Lichénol.* 34: 282, 1966 (Schuster 1966a). *syn. nov.* (ex description, illustration and specimens seen in F). Type:—NEW ZEALAND. South I.: Fiordland Nat. Park, Route Burn track between Earland Falls and Lake Mackenzie, W slope of Humboldt Mts., Upper Hollyford Valley, 4200-4500 ft., *Schuster* 49471b (holotype F, *non vidi*).
- = *Anastrophyllum crenulatum* R.M.Schust., *Hepat. Anthocerotae N. Amer.* 2: 740, 1969 (Schuster 1969), *syn. nov.* (ex description and illustration). Type:—ARGENTINA. Tierra del Fuego: Cerro Garibaldi, *Schuster* 58304a (holotype F, *non vidi*).
- = *Anastrophyllum appendiculatum* N.Kitag., *J. Hattori Bot. Lab.* 33: 210, 1970 (Kitagawa 1970), *syn. fide Váňa* (1975). Type:—MALAYSIA. Sabah: Mt. Kinabalu, granodiorite slope between Low's Peak and Sayat Sayat, 3700-4050 m, 1963, *Mizutani* 2912 (holotype NICH-252912!).
- = *Anastrophyllum hypocladopsis* R.M.Schust., *Beih. Nova Hedwigia* 119: 315, 2002 (Schuster 2002a), *syn. nov.* (ex description and illustration). Type:—VENEZUELA. Estado Tachira: Páramo de Tama, Villa Paez, 3000 m, *Schuster* 76-1941a (holotype F, *non vidi*).
- = *Anastrophyllum intermedium* R.M.Schust., *Beih. Nova Hedwigia* 119: 303, 2002 (Schuster 2002a), *nom. inval.* (Art. 37.7; herbarium not indicated), *syn. nov.* (ex description and illustration). Original material:—VENEZUELA. Estado Korida: Sierra Nevada de Korida, above Loma Redonda, *Schuster* 76-1411c (F, *non vidi*).
- = *Anastrophyllum ambiguum* R.M.Schust., *Beih. Nova Hedwigia* 119: 305, 2002 (Schuster 2002a), *nom. inval.* (Art. 36.1; no Latin description), *syn. nov.* (ex description). Original material:—NEW ZEALAND.

***Sphenolobus austroamericanus* (Váňa) Váňa, comb. nov.**

Basionym:—*Anastrophyllum austroamericanum* Váňa, *J. Hattori Bot. Lab.* 48: 22, 1980 (Váňa 1980).

Type:—COLOMBIA. Boyacá: Páramo de La Laguna Negra, 3745 m, *Cleef* 7269 (holotype U!, isotype PRC!).

***Plicanthus difficilis* (Steph.) L.Söderstr. et Váňa, comb. nov.**

Basionym:—*Chandonanthus difficilis* Steph., *J. & Proc. Roy. Soc. New South Wales* 48: 101, 1914 (Stephani & Watts 1914).

Type:—VANUATU. Aneityum, Gunn, hb. Watts 29 (holotype G-60753!).

Note:—*Chandonanthus difficilis* is closely related to *Plicanthus hirtellus*. However, the type specimen is vigorous and more dense with more imbricate leaves with large marginal teeth. Underleaves are much smaller than normal sized *Plicanthus hirtellus* and very ciliate. For that reason we retain the species until the *Plicanthus* / *Chandonanthus* / *Tetralophozia* complex have been studied further, preferably also molecularly.

***Plicanthus hirtellus* (F.Weber) R.M.Schust., Nova Hedwigia 74: 492, 2002 (Schuster 2002b).**

Basionym:—*Jungermannia hirtella* F.Weber, *Hist. Musc. Hepat. Prodri.*: 50, 1815 (Weber 1815).

- = *Chandonanthus gracilis* Herzog, *Hedwigia* 66: 341, 1926 (Herzog 1926), *syn. nov.* Type:—INDONESIA. Ceram: Hoale-Pass, ca 1600 m, 1911, *Streman* (holotype JE!). Note:—a slender form of *Plicanthus hirtellus* with reflexed, very ciliate, underleaves. In this respect it approaches *Plicanthus hamatus* which was treated as a synonym to *Plicanthus hirtellus* by Kitagawa (1981).
- = *Chandonanthus perloii* Gola, Mem. Reale Accad. Sci. Torino, ser. 2, 65: 7, 1914 [1916] (Gola 1916), *syn. nov.* Type:—KENYA, ad cortices in M. Kinangop in Africa orientali. M. Kinagop sulle corteccie delle eriche m. 4500 msm. 3 January 1909, *P. Saroglia* (holotype FT!).

Acknowledgement

We thank Hans-Joachim Zündorf (JE) for help with specimens. The Early Land Plants Today project (ELPT) has been generously supported in part by the Global Biological Information Facility (GBIF) Seed Money Award No.2007-41, activities facilitated in part by funding from the Biodiversity Synthesis Center of the Encyclopedia of Life (BioSynC), partial funding from the National Science Foundation (Award No's 0749762, 1115002), the Warwick Foundation, and the Negaunee Foundation.
