*Author for correspondence

Lophozia hyperarctica (Schuster 1961: 967) was described from Ellesmere Island, Canadian Arctic. However, the author stated that the species occurred in very small patches and made a collection of them in a small area, but giving every small collection a separate collection number, thus making several gatherings out of them. When describing the species he used 5 differently numbered gatherings stating “these five collections extremely skimpy, coming from the same locality and to be considered the collective representing the type” thus violating ICN Art. 41.2 (McNeill *et al.* 2012). This mistake was overlooked when transferring the taxon to *Massula hyperarctica* (R.M.Schust.) Schljakov (1972: 318), *Massularia hyperarctica* (R.M.Schust.) Schljakov (1985: 232), *Schistochilopsis hyperarctica* (R.M.Schust.) Konstant. in Konstantinova & Vasiljev (1994: 125) and *Lophozia grandiretis* var. *hyperarctica* (R.M.Schust.) Damsholt (2008: 98). The species is validated here.

***Schistochilopsis hyperarctica* Konstant. et L.Söderstr., sp. nov.**

Based on:—*Lophozia hyperarctica* R.M.Schust., Canad. J. Bot. 39: 967, 1961 (Schuster 1961) nom. inval. (Art. 40.2; based on more than one gathering). Type:—CANADA. Ellesmere: Alert Weather Station, R.M.Schuster 35142 (F!, holotype).

Note:—The reference to the description in Schuster (1961: 967), together with the reference to the single gathering selected here, validates the taxon.

Acknowledgements

The Early Land Plants Today project (ELPT) has been generously supported in part by the Global Biological Information Facility (GBIF) Seed Money Award No.2007-41, activities facilitated in part by funding from the Biodiversity Synthesis Center of the Encyclopedia of Life (BioSynC), partial funding from the National Science Foundation (Award No's 0749762, 1115002), the Warwick Foundation, and the Negaunee Foundation.
