Abstract

A new species of endogeous, eyeless Molytine weevil collected in La Palma island (Canary Is.), *Baezia vulcania* sp. n., is described and compared with its closest ally, *B. litoralis* Alonso-Zarazaga & García, 1999. Biological data are provided. The genus is new to La Palma I.

Key words: Curculionidae, Molytinae, *Baezia vulcania*, sp. n., endogeous, edaphobiontic, La Palma I., Canary Islands.

Introduction

A sample of blind weevils collected in the Cueva de Los Palmeros (García, 1996) proved to be a new species of the recently described genus *Baezia* (Alonso-Zarazaga & García, 1999). This genus is endemic to the Canary Islands, known previously only from the island of Tenerife, where it is represented by its type species, *B. litoralis* Alonso-Zarazaga & García, 1999. Both known species have marked adaptations to an edaphobiontic way of life. This species was listed by García (1996) as Curculionidae *indet.*
