Abstract

Four new Gulf of Mexico records and nine geographic range extensions of peracarid crustaceans within the Gulf are presented for the southwestern Gulf of Mexico. The new records were obtained from plankton samples collected in the inlets of three Mexican coastal lagoons: Río Soto la Marina, Tamaulipas; Camaronera Lagoon, Veracruz and Términos Lagoon, Campeche. The new records include seven amphipod species (*Caprella penantis*, *Gammaropsis atlantica*, *Monocorophium insidiosum*, *Hartmanodes nyei*, *Metaharpinia floridana*, *Westwoodilla* sp., *Parametopella texensis*), one cumacean (*Cyclaspis* sp.) and five isopods (*Excorallana berbicensis*, *Anilocra abudefdifi*, *Sphaeroma walkeri*, *Armadilloniscus* sp., *Erichsonella attenuata*).

Key words: Peracarids, new records, range extension, inlets, Gulf of Mexico

Introduction

Papers dealing with the specific composition of peracarid communities from the coastal zone of the southwestern Gulf of Mexico have been based on those communities occurring in lagoon systems (Cantu-Díaz & Escobar-Briones, 1992; Winfield *et al.* 2001), on coral reefs (Carrera & Vargas, 1997) and on sandy beaches (Arriaga, 1985). Peracarids that occur in the inlets have been overlooked in all surveys from this region.

This paper reports on peracarid material from three lagoon-system inlets from the southwestern Gulf of Mexico. The localities surveyed are: Río Soto la Marina (SM),
