ABSTRACT

Twelve species of eugnamptine weevils (Coleoptera: Rhynchitidae) are recorded from the La Selva Biological Station in northeastern Costa Rica. They include 11 species of *Eugnamptus* Schoenherr and one species of *Hemilypus* Sharp. Eight of the 11 species of *Eugnamptus* are **new species**: *E. balius*, *E. bellus*, *E. herediensis*, *E. longiusculus*, *E. pusillus*, *E. rostralis*, *E. sarapiquensis*, and *E. sulcicollis*. The single species of *Hemilypus* and three of the 11 *Eugnamptus* species are known valid species: *H. obliteratus* Sharp, *E. basalis* Sharp, *E. laticeps* Voss, and *E. suturalis* Sharp. Lectotypes are designated for *E. laticeps* Voss, *E. basalis* Sharp, *E. suturalis* Sharp and *H. obliteratus* Sharp. *Eugnamptus godmani* Sharp is treated as a **new synonym** of *E. basalis* Sharp. Each species is treated in standard taxonomic fashion and a key to the La Selva species based on adult color and
