Abstract

Changes to the taxonomy of North and Central America *Leptohyphes* (Ephemeroptera: Leptohiphidae) include the following. *Leptohyphes ferruginus* and *L. apache* are revalidated. The adult stage of *L. ferruginus* is diagnosed based upon subimagos and a reared female adult and a partially emerged male adult. *Leptohyphes piraticus* is placed as a junior synonym of *L. ferruginus*. *Leptohyphes vulturinus* and *L. zelus* are shown to be junior synonyms of *L. zalope*. *Leptohyphes hispidus*, *L. lumas*, *L. spiculatus*, and *L. succinus* are placed as junior synonyms of *L. apache*. *Leptohyphes castaneus*, *L. tarsos*, and *L. consortis* are placed as junior synonyms of *L. sabinas*. *Leptohyphes brunneus* is placed as a junior synonym of *L. musseri*. *Leptohyphes lestes* is newly reported from the USA. Numerous problems and errors associated with original descriptions of *Leptohyphes* species are discussed. A taxonomic key is presented to all known larval stages of North and Central American species of *Leptohyphes*.

Key words: Leptohiphidae, *Leptohyphes*, revision
