Abstract

The identity of *Scytalopus speluncae* (Ménétriés, 1835) (Aves: Passeriformes: Rhinocryptidae), a tapaculo from southeastern Brazil, has been the matter of debate during the last eight years. A group of ornithologists considers that the nomen *Scytalopus speluncae* should be attributed to a species endemic to coastal mountains of southeastern Brazil, whereas another group considers it a species from the drier environments of another mountain belt in Minas Gerais, southeastern Brazil. Both research groups disagree on the identity of the still extant but damaged alleged holotype, deposited at the Zoological Institute of the Russian Academy of Sciences, St. Petersburg, on the identity of the holotype specimen illustration from a plate accompanying the species description, and even on the type locality. To further complicate this matter of identity, members of each research group, based on their own interpretations of the identity of *Scytalopus speluncae*, described and named again the two species with different nomina, erecting at least one unnecessary nomen. After almost ten years of a debate, there is still no consensus on the identity of the species, and there are now at least three available nomina for apparently only two distinct biological species. As taxonomists belonging to fields of zoology other than ornithology, and realizing the above situation is mainly a nomenclatural one, we herein present a summary of the contentious issue, try to distinguish what seems to be facts and speculation and based on these we consider the rules of the International Code of Zoological Nomenclature (the *Code*) whenever appropriate, in the hope of bringing some objectivity to the debate. We conclude that no unequivocal evidence was presented to decide to which species the type specimen belongs solely based on its morphological characters, since the holotype presents considerable damage. On the other hand, the original designation of the type locality by Ménétriés (1835) as São João del Rei, in southeastern Brazil, is unquestionable. Thus, the posterior re-designation of the type locality by a group of ornithologists was not done according to the *Code*. Contrary to the proposition made by a group of ornithologists that the nomen *Scytalopus speluncae* should be maintained to the species so called up to 2006 until further evidence confirms the identity of the holotype, we here argue that for now the nomen should be applied to the only species known to occur in the vicinities of the type locality, as established by the author of the species. Nevertheless, we also agree that obtaining molecular data from the holotype should be attempted to definitely solve the query.

Key words: *Scytalopus notorius*, *Scytalopus speluncae*, *Scytalopus petrophilus*, Mouse-colored Tapaculo, Rock Tapaculo, taxonomy

Introduction

Scytalopus Gould, 1837 is a group of small (10 to 14 cm), blackish to grey passerine birds endemic in the Neotropics, ranging from Costa Rica, in the North, to Argentina's Tierra del Fuego, in the South (Krabbe &

Scytalopus speluncae (Ménétriés, 1835)

Malacorhynchus speluncae Ménétriés, 1835: 527. Holotype, by monotypy: adult male, ZISP 145251: Brasil, Minas Gerais, São João del Rei, Gruta da Pedra.

Scytalopus petrophilus Whitney, Vasconcelos, Silveira & Pacheco, 2010: 73–74. Holotype, by original designation: adult male, MZUSP 78822: Brasil, Minas Gerais, Caeté, Serra da Piedade. Synonymized by Raposo *et al.* (2012).

Scytalopus notorioides Raposo, Stopiglia, Loskot & Kirwan, 2006

Scytalopus notorioides Raposo, Stopiglia, Loskot & Kirwan, 2006: 44–45. Holotype, by original designation: adult male, MNRJ 36652. Brasil, Rio de Janeiro, Nova Friburgo.

Acknowledgments

We are indebted to Marcelo O. Gonzaga (arachnologist; Universidade Federal de Uberlândia, Brazil) and Lívia Echternacht (botanist; Universidade Federal de Uberlândia), who kindly read and commented on earlier versions of the manuscript. Marcos Rodrigues (Universidade Federal de Minas Gerais, Brazil), an ornithologist not involved in the contention, and Niels K. Krabbe (ornithologist; University of Copenhagen, Denmark), expert on *Scytalopus* taxonomy, also made relevant comments on the first version of the manuscript. Roger Bour (cheloniologist; Muséum National d’Histoire Naturelle, France) helped with the correct spelling of Ménétriés and is to be credited for the information provided in footnote 1. One member of Raposo’s group (M.A. Raposo himself) and two members of Maurício’s group (José Fernando Pacheco and Marcelo Ferreira de Vasconcelos) agreed to read and comment on the first submitted version of the manuscript. Their comments were very useful to us. Alessandro Minelli, as the Zootaxa editor for nomenclature, and two anonymous referees also made valuable comments on the first version of this manuscript. One of the referees should be credited for the insight provided in footnote 7.
