Abstract

The Neotropical fauna of saucer bugs (Naucoridae) currently includes four monotypic genera. Recent extensive collecting in Venezuela has produced three new species in two of these genera. In addition, undetermined Guyanan specimens of one of the new species were found in the United States National Museum of Natural History. Thus, described here are *Placomerus obscuratus* n. sp. from Guyana and Venezuela with brachypterous and macropterous hindwing forms, and two species of *Procryphocricos* from Venezuela. *Procryphocricos quiu* n. sp. is described from the brachypterous forewing form and *Procryphocricos macoita* n. sp. from both brachypterous and macropterous forms. Previously described species also are discussed.

Key words: Nepomorpha, Naucoridae, *Procryphocricos*, *Placomerus*, Venezuela, Guyana, aquatic Heteroptera, new species

Introduction

The family of saucer bugs (Naucoridae) in the Neotropics is represented by 12 genera, two of which, *Ambrysus* and *Limnocoris*, are hyperdiverse with more than 70 described species in each. In sharp contrast, four of the other Neotropical genera have been monotypic and include *Decarloa* known only from Hispaniola, *Interocoris* known only from Mexico, and *Placomerus* and *Procryphocricos* from South America.

Placomerus (Naucorinae) was described from several countries in southern South America (Bolivia, Brazil, and Paraguay) and was distinguished from the superficially similar *Pelocoris* using 14 attributes (La Rivers 1956). Additional records from Argentina (Lopez Ruf & Bachmann 1991) and other localities in Brazil have been presented more recently (e.g., Moreira *et al.* 2011). *Procryphocricos* (Cryphocricinae) was described by Polhemus (1991) based on two male specimens collected in Colombia. Since then, additional specimens have been collected from the type locality and the female was described by Sites & Alvarez Arango (2010).

Presented here are the descriptions of one new species of *Placomerus* from Guyana and Venezuela, and two new species of *Procryphocricos* from Venezuela.

Material and methods

Recent extensive sampling throughout much of Venezuela has provided many fresh specimens of six genera of saucer bugs for examination. Habitats sampled include streams, rivers, waterfalls, ponds, lakes, reservoirs, swamps, and springs.

Photographs of collection sites identified as L-numbers are available in a Locality Image Database via a link from the internet site of the Enns Entomology Museum, University of Missouri. Length and width are given as a mean and range for paratypes and all measurements are in mm. Length of the body is measured from the anterior

Etymology. The specific epithet is a noun in apposition and is the name of the river from which the type series was collected.

Repositories. The holotype is deposited in Museo del Instituto de Zoología Agrícola, Maracay, Venezuela. Paratypes are deposited in Universidad del Zulia, Maracaibo, Venezuela; Enns Entomology Museum, University of Missouri; and the United States National Museum of Natural History, Washington D.C.

Type material examined. HOLOTYPE ♂: VENEZUELA: Barinas: Río Quiu nr Quiri, 8° 03.341'N, 70° 56.597'W, 203 m, 15 July 2009, L-1083, river margins / Colls Sites, Shepard, Short, Camacho, García, Gustafson, VZ0907 1503S. PARATYPES: same data as holotype (2 brachypterous ♂, 4 brachypterous ♀).

Acknowledgments

We are most grateful to Andrew Short (University of Kansas) for graciously including us in his larger project to study the aquatic insects of Venezuela through NSF grant #DEB-0816904, and for making available the field notes of the late Paul Spangler. We thank Cheryl Barr (University of California-Berkeley), Thomas Henry and Michele Touchet (United States National Museum of Natural History), and Andrew Short for the loan of specimens. We also thank Norman Penny (California Academy of Sciences) and Mick Webb (British Museum of Natural History) for allowing us to examine specimens under their care. We are grateful to Louisa Fernanda Álvarez Arango (Universidad Católica de Oriente) for providing comparative specimens of *P. perplexus*. We thank Luke Jacobus (Indiana University), Carlos Molineri (Universidad Nacional de Tucumán, Argentina), Rodolfo Novelo-Gutiérrez (Instituto de Ecología, Xalapa), Barry Poulton (USGS, Columbia, Missouri), David Bowles (USFW, Springfield, Missouri) and William Shepard (Pinole, California) for providing identifications of rootmat inhabitants. Herbert Zettel (Naturhistorisches Museum-Vienna) kindly provided a critical review of this manuscript. Finally, we thank William Shepard for the loan of his curiously superior net which enabled maximally fruitful collections of *P. macoita*.
