Abstract

A new genus of stick insects, *Brockphasma* Ho gen. nov., with the type-species, *Brockphasma spinifemoralis* Ho, Liu, Bresseel & Constant spec. nov., is described and illustrated from Vietnam. Both sexes, the egg and the first instar nymph are described and figured. Data on the habitat and natural foodplants are provided. *Brockphasma* Ho gen. nov. is differentiated from other genera in Neohiraseini by spinose occiput, anterior region of mesonotum with a spinose hump and spinose anterodorsal and posterodorsal carinae of femora. A key to the genera of Neohiraseini from Vietnam is given.

Key words: Neohiraseini, Vietnam, new genus, new species

Introduction

Neohiraseini Hennemann & Conle, 2008 is a small tribe and is principally restricted to Indo-China area (Hennemann & Conle, 2008). The tribe comprises seven genera which are recognizable by their robust and more or less spinose body and circular or oval egg structure without distinct capitulum. The tribe was first placed in Lonchodinae by Hennemann & Conle (2008). Currently Bradler *et al.* (2014) have provided compelling evidence that *Neohirasea* Rehn, 1904 (= *Paracentema* Redtenbacher, 1908) and related taxa form a subordinate lineage in Necrosciinae.

In Vietnam, the Neohiraseini are presented by four different genera, *Andropromachus* Carl, 1913 (= *Spiniphasma* Chen & He, 2000), *Cheniphasma* Ho, 2012, *Neohirasea* Rehn, 1904 and *Spinohirasea* Zompro, 2002 (Hennemann & Conle, 2008; Ho, 2013a). In this study, a new genus *Brockphasma* Ho gen. nov. and its type-species *B. spinifemoralis* Ho, Liu, Bresseel & Constant spec. nov. are described and illustrated from Vietnam. A key to the genera of Neohiraseini from Vietnam is also provided.

Material and methods

The type-specimens are deposited in China Agricultural University, Beijing, China (CAU), Hong Kong Entomological Society, Hong Kong, China (HKES), Institute of Ecology and Biological Resources, Vietnamese Academy of Sciences, Hanoi, Vietnam (IEBR) and Royal Belgian Institute of Natural Sciences, Brussels, Belgium (RBINS).

Due to their nocturnal behaviour, most phasmids including the genus *Brockphasma* Ho gen. nov. were collected at night. A light-weight and water-proof head torch: Petzl MYO RXP was used during collecting. Females were kept alive in a mesh pop up cage (exo terra explorarium) for producing eggs. The wild caught

(Lao Cai) is thanked for his kind help during the field trip in Vietnam. Dr. Bruno Kneubühler (Switzerland) is thanked for his fantastic pictures and for all his help in breeding the species brought back from the field. Dr. Hong Thai Pham and Mr Hoang Vu Tru (IEBR) are acknowledged for all their help and friendship during the collecting trip in Bach Ma National Park. The second author's collecting trips were supported by the National Natural Science Foundation of China (No. 41271063) and the Foundation for the Author of National Excellent Doctoral Dissertation of PR China (No. 201178). The third and fourth authors' collecting trip was supported through a grant issued by the capacity building Programme of the Belgian Global Taxonomic Initiative National Focal Point that runs with financial support from the Belgian Directorate-General for Development Cooperation.
