Abstract

The megophryid frogs *Leptobrachella brevicrus*, *Leptolalax dringi* and *Megophrys dringi* are species exclusively known from highly localised areas in isolated mountain ranges on Borneo. The tadpoles and adults in this study were collected at the shared type locality for the three species in Gunung Mulu National Park, Sarawak, Malaysia (Borneo). The species identities of larvae were determined via comparison to syntopic adults using DNA barcoding techniques based on partial 16S rRNA mitochondrial gene sequences. The genetic data supported the status of the three taxa as valid species. Descriptions of colouration in life and after preservation, external morphological features, morphometric measurements and ecological notes in comparison to congeneric species are supplied. The tadpoles of *L. brevicrus* and *L. dringi* show similar adaptations to a fossorial lifestyle. These include an elongated, vermiform body, a relatively long tail and small eyes. Both were found in the gravel beds of a small mountain stream. In contrast, the larvae of *M. dringi* are adapted to occupying and feeding at the surface of pools within the stream.

Key words: Borneo, *Leptobrachella brevicrus*, *Leptolalax dringi*, *Megophrys dringi*, anuran larvae, external morphology, fossorial tadpole, rheophilic tadpole, phylogenetic relationships, DNA barcoding

Introduction

Although the true number of amphibian species on Borneo is probably vastly underestimated (Inger 1999; Inger *et al*. 2006), the island is already considered a biodiversity hotspot for amphibians of global importance (Myers *et al*. 2000). Its fauna is known to include a large number of micro–endemic species, many of them from the numerous isolated peaks and ridges of the mountain range in the north–eastern part of Borneo (e.g. Inger 1966; Dring 1983; 1983, 1987; Inger & Stuebing 1997, 2005; Dehling 2008, 2010, 2011). Gunung Mulu National Park in north–eastern Sarawak, Malaysia (Borneo) protects the sandstone formation of the Gunung Mulu massif, which rises up to reach 2,376 m a. s. l., and the limestone mountains of the Melinau formation (Hazebroek & Morshidi 2000).

The various species of Megophryidae Bonaparte are distributed across South and South–East Asia (amphibiaweb.org 2013; Frost 2014; Lathrop 1997; Li *et al*. 2011), making a significant contribution to the extraordinarily high amphibian diversity found on the islands of Sundaland. Borneo, the largest land unit of Sundaland, is home to 26 reported species of megophryid frogs, several of which have been discovered and described only recently (Inger & Stuebing 1997, 2005; Hamidy *et al*. 2012). Most megophryid frogs are nocturnal inhabitants of the floor of subtropical or tropical forests and are characterised by their impressive camouflage.
diagnostic characters for identification of the tadpoles within this community as a prerequisite for subsequent ecological and evolutionary research are now available (Table 3).

Acknowledgements

The Economic Planning Unit, The Prime Minister’s Department, Malaysia, and especially Munirah Abd. Manan, helped by granting permission to conduct research in Malaysia. We thank the Sarawak Forest Department and Sarawak Forestry Corporation, in particular Datuk Haji Len Taliff Salleh, Haji Ali bin Yusop, Bolhan Budeng, Azahari bin Omar, Oswald Braken Tisen, Mohamad bin Kohdi, Engkamat bin Lading and Mohd. Shabudin Sabki for providing advice and issuing collecting permits (NPW.907.4–36, NPW.907.4.2(IV)–3, NCCD.907.4.4 (Jld.VI)–106; Park Permit 3/2009; 62/2011) and export permits (07094–97, 08961). We are grateful to Pui Yong Min, André Jankowski, Maximilian Dehling and our local guides, including John B. Satu, Nicholas Wan Tinggang Freddy, Kenneth Simon Batang, Richardson Oswald Burong Frederick Francis and Paya Ding for assistance in the field. Beatrice Blöchlinger and Chris Sherry performed technical tasks with admirable skill. We thank the University of Bern and Ole Seehausen for their significant support. We are grateful for the contribution made by Zweibrüder Optoelectronics and Leder Fuchs, Göppingen, to our field work. Bornean field work was funded by grants from the Volkswagen Stiftung (No. I/79 405 to A. Haas and I. Das) and the Swiss Academy of Sciences (to S.T. Hertwig). We wish to express our gratitude to Lucy Cathrow for improving the language of this manuscript. Finally, we wish to express our gratitude to the anonymous reviewers who contributed helpful comments for the improvement of this paper.
