Abstract

We describe a new species of large *Oedura* from the Oscar Range on the southern edge of the Kimberley Craton in north-western Australia. *Oedura murrumanu* sp. nov. can be distinguished from all congeners by the combination of large size (snout-vent length to 103 mm), moderately long and slightly swollen tail, tiny scales on the dorsum, fringe of laterally expanded lamellae on each digit, and 6–7 paired distal subdigital lamellae on the fourth toe. The new species is the first endemic vertebrate known from the limestone ranges of the southern Kimberley; however, this area remains poorly surveyed and further research (particularly wet season surveys and genetic analyses) is required to better characterise regional biodiversity values.

Key words: Australian Monsoonal Tropics, endemism, lizard, mesic refugia, Oscar Range, saxacoline

Introduction

The Kimberley region of north-west Australia is characterised geologically by an array of ancient and highly weathered exposed rock formations (Tyler *et al.* 2012; Pepper & Keogh 2014). One distinctive and discrete geological feature of this region is a fringe of exposed fossilized Devonian limestone reefs that form a broken chain around much of the southern and eastern edge of the Kimberley Craton (Tyler 2011; Tyler *et al.* 2012). In the south-west Kimberley the exposed portion of these limestone deposits form the Oscar and Napier Ranges. These low (<100 m above the surrounding plains) and narrow ranges (generally less than a few km wide) are isolated from other ranges of exposed rock in the Kimberley by flat low-lying plains. While they are home to a diverse radiation of micro-endemic Camaenid snails (Solem 1985; Cameron 1992), no endemic vertebrates are currently recognised from this area.

Australian Velvet Geckos (genus *Oedura*) are moderate to large geckos (snout-vent length [SVL] 69–113 mm) with a continuous distribution spanning much of northern and eastern Australia, with further isolates in the arid zone (Pilbara, Central Ranges and Flinders Ranges) (Oliver *et al.* 2012a, 2014; Wilson & Swan 2013). Two endemic species of *Oedura* are currently recognized from the Kimberley region: *O. gracilis* King, 1984 and *O. filicipoda* King, 1984. The former occurs over most of the Kimberley plateau and extends into the far north-west Northern Territory, while the latter is restricted to the deeply dissected sandstone plateaus of the relatively high rainfall zone of the north-west Kimberley (from the Mitchell Plateau in the north to the Artesian Range to the south; Fig. 1) (Atlas of Living Australia 2013).

For nearly a decade, an additional distinctive *Oedura* has been known from the Oscar Range of the south-west Kimberley (G. Gaikhorst, M. Kearney, B. Stewart, pers. comm.), however, no specimens have been available for taxonomic study. During recent fieldwork in the south-west Kimberley we were able to collect a small series of this form to assess if it is distinctive from other recognised *Oedura*, especially *O. filicipoda* which it resembles.

We found the Oscar Range form to be morphologically and genetically distinctive from all other *Oedura*
Acknowledgements

We thank Clive Aiken and the Bunuba Rangers for their permission and co-operation in helping us to undertake research on the traditional lands of the Bunuba people. June Oscar and Diane Chungol kindly provided advice on the correct use and spelling of Bunuba words. We also thank Tracy Sonneman (Western Australia Department of Parks & Wildlife, Broome) for extensive advice, logistical support, and help with permits, Paul Horner and Susan Perkins for providing photographs and support in the field, and Glen Gaikhorst, Michael Kearney, Bill Stewart, and Corrin Everitt for bringing this taxon to our attention and for sharing their observations. Specimens were collected and preserved under Western Australian permit number SF009528. This work was supported by grants from the Australian Research Council to Paul Oliver, Michael Lee, and Paul Doughty, a Melbourne University Collaboration grant to Jane Melville and Paul Oliver, and a Mckenzie Postdoctoral fellowship to Paul Oliver from Melbourne University.
