Abstract

This paper deals with 7 subfamilies, 30 genera and 82 species of Tetrigidae from Shiwanshan, Guangxi in China. Among them three new species of the subfamily Metrodorinae are described, namely *Mazarredia convexaoides* Deng & Zheng sp. nov., *Mazarredia shiwanshanensis* Deng & Zheng sp. nov. and *Bolivaritettix shiwanshanensis* Deng & Zheng sp. nov. Also, new synonyms are presented: *Miriatroides quadrivertex* Zheng & Jiang, 2002 syn.nov. is synonymized with *Spadotettix hainanensis* Günther, 1939, thus genus *Miriatroides* Zheng & Jiang, 2002 with the genus *Spadotettix* Hancock, 1910. Finally, brief comments on faunistic characters of Tetrigidae from Shiwanshan are given.

Key words: Grasshoppers, *Mazarredia*, *Bolivaritettix*, new taxa, faunistic components, checklist

Introduction

The Shiwanshan is a mountain range in Guangxi (southern China). The whole range stretches from the southwest to the northeast, across from 107°05' to 108°20' E longitude and from 21°38' to 22°30' N latitude. It is in the southern most part of the mainland China, lying to the southeast of the Yunnan-Guizhou Plateau, and extending from the southern part of Guangxi into the northern part of Vietnam. Its highest peak is 1,462 m above sea level. It covers counties, such as Fangcheng, Shangsi, Qinzhou, Longzhou and Ningming, which are all located in a low coastal region within the Tropic of Cancer and adjacent to the South China Sea, so they all have a warm and humid climate, and lush vegetation. As a result, the Shiwanshan is rich in biological diversity, especially for insects. Although the general species diversity index from the Shiwanshan National Natural Reserve (NNR) ranks second in China—just after the Nujiang Canyon, the tetrigid fauna (Orthoptera: Tetrigidae) of the Shiwanshan region is almost completely unknown to the academia. Therefore, the aim of our study is to investigate tetrigids in the region.

The study is based on the specimens collected from June to October in 2012 and 2013 in the Shiwanshan region. Altogether, we recorded 82 species belonging to 30 genera and 7 subfamilies. Three new species of Metrodorinae are described: *Mazarredia convexaoides* Deng & Zheng sp. nov., *Mazarredia shiwanshanensis* Deng & Zheng sp. nov. and *Bolivaritettix shiwanshanensis* Deng & Zheng sp. nov. Finally, brief comments are also made on faunistic characteristics of Tetrigoidea from the Shiwanshan.

Material and methods

Specimens collected in Shiwanshan NNR covered Fangcheng, Shangsi, Qinzhou and Longzhou counties, altogether 31 localities (Map 1, Table 1) on 300–600 m elevation. Specimens are deposited in the following

Zheng, sp. nov., *Teredorus guangxiensis* Zheng & Shi, 2003, *Coptotettix fangchengensis* Zheng & Jiang, 2002, *Hedotettix shangsiensis* Zheng & Jiang, 2003, *Tetrix grossifemura* Zheng & Jiang, 1997, *Euparatettix fanchengensis* Zheng, 2005, *Bannatettix guangxiensis* Zheng & Jiang, 1997. (5) Eurytopic components: Eurytopic species are also in very low proportion, only 3.66%, including three species, i.e. *Criotettix bispinosus* (Dalman, 1818), *Hedotettix gracilis* (Haan, 1843) and *Tetrix tenuicornis* (Sahlberg, 1891).

Acknowledgements

We thank to Jun-Yun ZHANG (Shiwanshan National Natural Reserve) for his useful support. We specially thank Zhao-Rong WU, Yi-Feng WEI, Da-Heng Yao, Yu-Hua DONG, Yan-Lan Feng (SCBHU) for collecting the specimens, thank to Prof. Li-Qiu WEI (SCBHU) and Prof. Guo-Fang JIANG (College of Life Sciences, Nanjing Normal University, Peoples Republic of China) for helps improving the manuscript. We also thank to anonymous reviewers for their modifications and suggestions. The project is supported by the National Natural Science Foundation of China (31160433) and Program for Excellent Talents in Guangxi Higher Education Institutions (08034) and the project of outstanding young teachers' training in higher education institutions of Guangxi.
