## Abstract

The genus *Eunatalis* Schenckling, 1909 is taxonomically revised to include twenty-two species. The following species are described as new: *Eunatalis auricoma*, *Eunatalis flavopilosa*, *Eunatalis foveata*, *Eunatalis ninae*, *Eunatalis pernodulosa*, *Eunatalis punctata*, *Eunatalis schopfi*, *Eunatalis spadicea* and *Eunatalis villosa*. *Eunatalis blackburni* (Waterhouse, 1894), n. syn. is placed in synonymy with *Eunatalis lugubris* (Blackburn, 1890), *Eunatalis longicollis* (Blackburn, 1890), n. syn. is placed in synonymy with *Eunatalis hirta* (Blackburn, 1890); *Eunatalis lata* (Waterhouse, 1894), n. syn. and *Eunatalis alternicostata* (Kuwert, 1893), n. syn. are synonymized with *Eunatalis semicostata* (Blackburn, 1888). A key to the species, color photographs, genital figures and distribution maps are provided.

**Key words:** Australian species, taxonomy, identification key, genital figures, distribution maps

## Introduction

In recent times the higher classification of Cleridae has undergone considerable categorial oscillations (Opitz 2002a) and there is a “general morphological imbalance in the delimitation of genera and the lack of a credible suprageneric classification” (Opitz 2010). Clerinae, the most species-rich clerid subfamily, constitutes approximately 46% of all species in the family Cleridae, it includes 107 genera and 1711 species (Gerstmeier, in press).

Little attention has been focused on the Australian clerid fauna since Corporaal’s world catalogue (Corporaal 1950) except Winkler (1972, 1989), Gerstmeier (1990a, 1990b, 1991, 2001, 2002), Matthews (1992), Opitz (2002b), Kolibáč (2003) and Bartlett (2009a–2009d, 2010).

The first species of the genus *Eunatalis* Schenckling, 1909, described as *Notoxus porcata* by Fabricius in 1787, was transferred to the genus *Natalis* Laporte, 1836 by Spinola (1844). For a long time there was no generic differentiation between the South American and the Australian species until Schenckling (1909) erected *Eunatalis*

for the species of the Australian region. Kolibáč (1998) synonymized *Metademius* Schenkling, 1899, *Eunatalis* Schenkling, 1909 and *Cormodes* Pacoe, 1860 with *Natalis*. Solervicens (2007) reinstated *Metademius* and *Eunatalis* as valid genera, but did not comment on the status of *Cormodes*. Further assessment of these genera is required in order to clarify their taxonomic status. Therefore we have restricted the scope of our revision to *Eunatalis* only. The species *Eunatalis dregei* (Perroud, 1864) and *Eunatalis triangularis* (Perroud, 1864) were excluded from this revision, they belong to the new genus *Kanaliella* gen. n. (Gerstmeier & Seitner 2013).

The genus *Eunatalis* is a well known representative of the Australian fauna, including the largest clerid species (*Eunatalis laevis* (Waterhouse, 1894), circa 53 mm).

According to literature sources, *Eunatalis* larvae prey upon timber borers within trunk of *Eucalyptus* trees and adults may be found under eucalypt bark (Bashford 1994, 2004, McKeown 1944, Moore, 1989, 1990, Wainer 1979). While documenting the life history of *Epithora dorsalis* Macleay (Cerambycidae) Bashford (1994) noted that larvae of *Eunatalis porcata* (one of its predators) moults five times and consumes up to 23 borer larvae during a two year period, then devours a cerambycid pupa before pupating within the cell of its prey. Species of *Eunatalis* are also reported to omit a strong-smelling secretion (Hawkeswood 1987), or inflict a painful bite (Moore 1990), if handled. Specimen labels reveal that *Eunatalis* have been found in association with brigalow (*Acacia harpophylla*), bendeem (*Acacia catenulata*), raspberry jam (*Acacia acuminata*) and prickly pine (*Bursaria incana*). Further label data indicates that specimens have been collected in vine scrub, *Triodia* (Poaceae) and *Atriplex* (Chenopodiaceae) habitats. Collecting methods include flight intercept trap, malaise trap, pyrethrum fogging and light trapping (mainly UV).

Prior to this revision, *Eunatalis* contained 20 species (Corporaal 1950) with an exclusive distribution in the Australian region (Australia, Tasmania, New Guinea, New Caledonia). In the present revision nine species are described as new, four species are synonymized. *Eunatalis cribripennis* (Boisduval, 1835) is excluded from this revision as no type material could be located. A determination key to the resulting 22 species of *Eunatalis* is presented. Distribution maps, habitus photographs and illustrations of male external reproductive organs, pygidium and ventrite VI are illustrated.

The following species are recognized:

- Eunatalis auricoma* Gerstmeier & Seitner **n. sp.**  
*Eunatalis debilis* (Blackburn, 1900)  
*Eunatalis fasciata* (Blackburn, 1890)  
*Eunatalis flavopilosa* Gerstmeier & Seitner **n. sp.**  
*Eunatalis foveata* Gerstmeier & Seitner **n. sp.**  
*Eunatalis hirta* (Blackburn, 1890)  
    = *Eunatalis longicollis* (Blackburn, 1890), n. syn.  
*Eunatalis integra* (Blackburn, 1899)  
*Eunatalis laevicollis* (Blackburn, 1899)  
*Eunatalis laevis* (Waterhouse, 1894)  
*Eunatalis lugubris* (Blackburn, 1890)  
    = *Eunatalis blackburni* (Waterhouse, 1894), n. syn.  
*Eunatalis mastersii* (MacLeay, 1873)  
*Eunatalis ninae* Gerstmeier & Seitner **n. sp.**  
*Eunatalis pernodulosa* Gerstmeier & Seitner **n. sp.**  
*Eunatalis planipennis* (Blackburn, 1899)  
*Eunatalis porcata* (Fabricius, 1787)  
*Eunatalis punctata* Gerstmeier & Seitner **n. sp.**  
*Eunatalis schopfi* Gerstmeier **n. sp.**  
*Eunatalis semicostata* (Blackburn, 1889)  
    = *Eunatalis lata* (Waterhouse, 1894), n. syn.  
    = *Eunatalis alternicostata* (Kuwert, 1893), n. syn.  
*Eunatalis spadicea* Gerstmeier & Seitner **n. sp.**  
*Eunatalis spinicornis* (Blackburn, 1890)

## Material and Methods

The study is based on 2440 specimens from 31 museums and private collections. Museum acronyms and curators are as follow:

AM	Australian Museum, Sydney, Australia	Dave Britton
ANIC	Australian National Insect Collection, Canberra, Australia	Adam Slipinski, Cate Leman
BMNH	The Natural History Museum, London, United Kingdom	Max Barclay, Beulah Garner
CDW	Collection Dostal, Wien, Austria	Alexander Dostal
CMLN	Collection Michael Langer, Niederwiesa, Germany	Michael Langer
CMSD	Collection Martin Seitner, Dietramszell, Germany	Martin Seitner
FMNH	Field Museum of National History, Chicago, USA	James Boone
HEC	Hope Entomological Collections, Oxford, United Kingdom	James E. Hogan
HNHM	Hungarian Natural History Museum, Budapest, Hungary	Otto Merkl
ISNB	Institut Royal des Sciences Naturelles de Belgique, Brussels	Pol Limbourg
JKCB	Jiri Kolibáč Collection, Brno, Czech Republic	Jiří Kolibáč
JRCP	Jakub Rolčík Collection, Praha, Czech Republik	Jakub Rolčík
MHNG	Muséum d'Histoire Naturelle, Geneve, Switzerland	Giulio Cuccodoro
MNHN	Museum National d'Histoire Naturelle, Paris, France	Thierry Deuve, Antoine Mantilleri
MRSN	Museo Regionale di Scienze Naturali, Torino, Italy	Luca Picciau
MSNG	Museo Civico di Storia Naturale "Giacomo Doria", Genova, Italy	Maria Tavano, Dr. Roberto Poggi
MTD	Museum für Tierkunde Dresden, Germany	Olaf Jäger
MZM	Moravian Museum, Brno, Czech Republic	Jiří Kolibáč
MZUF	Museo Zoologico "La Specola", Firenze, Italy	Luca Bartolozzi
NHMB	Naturhistorisches Museum Basel, Switzerland	Michel Brancucci
NMPC	National Museum, Prague, Czech Republic	Jiří Hájek
NMV	Museum Victoria, Melbourne, Australia	Catriona McPhee
QDPC	Queensland Primary Industries Insect Collection, Dutton Park, Australia	Justin S. Bartlett
QM	Queensland Museum, Brisbane, Australia	Dr. Federica Turco
RGCM	Roland Gerstmeier Collection, Munich,(deposited in the collection of the Technical University Munich, Animal Ecology), Germany	Roland Gerstmeier
SAMA	South Australian Museum, Adelaide, Australia	Peter Hudson
SDEI	Senckenberg Entomologisches Institut, Müncheberg, Germany	Lutz Behne, Stephan Blank
SMNS	Staatliches Museum für Naturkunde, Stuttgart, Germany	Wolfgang Schawaller
WAMP	Western Australian Museum, Perth, Australia	Terry Houston
ZMB	Zoologisches Museum Berlin, Germany	Manfred Uhlig
ZMUC	Zoological Museum, University of Copenhagen, Denmark	Alexey Solodovnikov

From all examined specimens the label data were transcribed and presented at the beginning of each species description. The depository of the specimen is given in parentheses.

The revision is based only on morphological studies including preparations of the male genitalia, the pygidium and the ventrite VI. At least, one male specimen (when available) was dissected. For this purpose the specimen was heated in distilled water and the genitalia were removed with fine forceps through small incisions made along the sides of the terminal abdominal segments. Aedeagi were cleaned of soft tissue in 10% KOH, cleared in 70% ethyl alcohol and submerged in glycerine, then stored in genital vials pinned below each specimen.

Measurements were made under a stereo microscope using an ocular micrometer. Total body length is the distance measured from the apical epistomal margin to the elytral apices. Elytral length was measured alongside the elytral suture and pronotal length was taken from the dorsal middle line. Pronotal width were measured at the broadest extreme, measurements of the elytral width were made across the middle. The scale bar is 1 mm (except as noted otherwise).

Habitus photographs of adult beetles were taken, as a series, using a DFC 490 digital camera fitted to a Leica Z6 stereo microscope, then composited with Leica LAS 3.8. automontage software.

Plot points of distribution maps were made with QuantumGIS (1.8.0) and are based on locality data sourced from specimen labels. These data included exact locality information based on longitude/latitude coordinates. Red lectotype labels were applied to newly designated lectotypes and paralectotypes.

The term antennomere is abbreviated to "A".

### ***Eunatalis* Schenkling, 1909**

Type species: *Notoxus porcatus* Fabricius, 1787: 127.

Schenkling 1909: 163; Elston 1921: 148; Kolibáč 1998: 191; Solervicens 2007: 57.

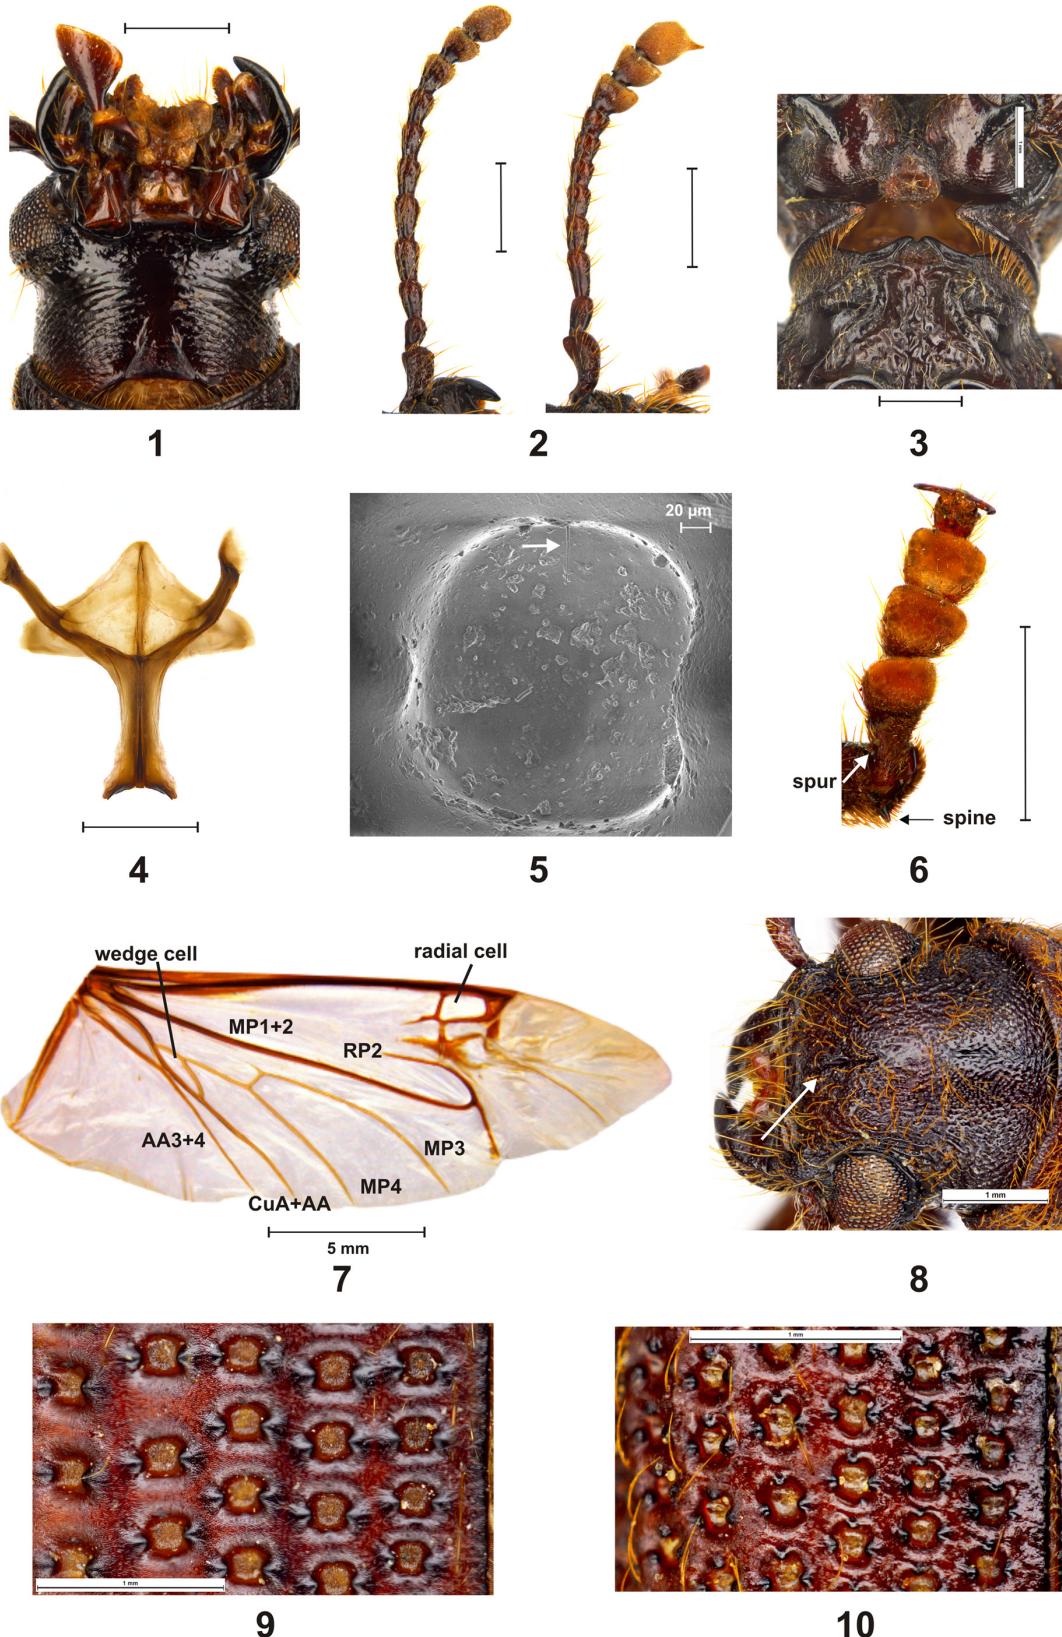

**Head:** Dark brown to black; vested with whitish to grey setae; labrum broadly emarginate, V-shaped, light brown to dark brown; terminal maxillary palpomeres with sides parallel to very weakly divergent and apex obliquely truncate, terminal labial palpomeres securiform (Fig. 1); eyes coarsely faceted, protruding laterally, margined; head including eyes as broad as or broader than anterior width of pronotum; interocular space from one to double eye width (as viewed from above); gular sutures converging, gular process conspicuous, with two papillae. Antennae with 11 antennomeres, filiform, light brown to black; antennomeres with dense, fine punctuation, terminal three antennomeres densely tomentose, forming a loose club, A11 in *E. spinicornis* acuminate (Fig. 2).

**Thorax:** Light brown to black; punctuation and pilosity variable, base and apex with fringe of setae, pilosity mostly grey to whitish; pronotum longer than wide, sides more or less sinuate, with wrinkles, middle always with an elongated groove (sometimes missing or weak); grooves of sub-basal collar on each side of pronotum fused or separated by a weak or distinct bar. Pro-intercoxal process narrow, broadly dilated distally; procoxal cavities opened to almost closed posteriorly (sometimes variable within a species); hypomeron tapering apically towards intercoxal process; mesoventrite with variable sculpture and punctuation, anterior mesoventral process distinct, sinuate, pit-shaped, slightly opened apically; posterior part of mesepisternon mostly smooth or slightly punctate (Fig. 3); metaventrite with a conspicuous discriminal line, more or less punctate and wrinkled. Scutellum round to oblong-ovate, light brown to black, with isolated lateral setae, slightly punctate. Metendosternite with conspicuous furcal arms, laminae broadly triangular (Fig. 4).

**Elytra:** Light brown to black; pilosity variable, mostly densely vested with anteriorly directed setae at the lower margin of elytrae, whitish to grey; elytral base not margined, lateral margins parallel or broadest behind middle, apices broadly rounded or with a conspicuous tooth, elytral punctuation arranged into ten striae (*E. laevis* with hidden punctures), the ninth stria is partly or completely vestigial, interstices with a fine microsculpture (wrinkled to punctate); diameter of punctations from base to apex similar, or diameter of punctations behind the middle decreasing or obsolete; punctuation round or oblong, with two or three nodules (a pair of lateral nodules, and one posterior nodule), nodules more or less sinuate, with a single seta beneath the basal nodule (Fig. 5); interstices in basal half flattened, posterior of middle sometimes more or less ridged. Hindwing with closed wedge cell, margin of radial cell strongly sclerotized, MP3, MP4, AA3+4 and CuA+AA reaching margin (Fig. 7).

**Legs:** Light brown to black; more or less pilose, inner edge of protibiae and sometimes mesotibiae with a row of short, thick bristles, with more or less conspicuous punctuation; profemora conspicuously swollen, protibiae slightly bent, mesotibiae more or less bent (except *E. semicostata* with almost straight mesotibiae), metatibiae straight to very slightly bent, all tibiae without longitudinal carinae, protibiae terminating in a short spine and a single spur, tibial spur formula 1-2-2; tarsal pulvilli formula 3-3-3, tarsal pulvilli broadly lobed, but not emarginate; claws simple (Fig. 6).

**Abdomen:** Six visible abdominal ventrites, with a more or less dense pilosity and punctuation. Ventrite VI in males straight or emarginate, in females rounded. Tegmen ventrally closed, phallobasic apodeme and struts distally more or less spoon-like, branches of spicular fork distally strongly broadened. Female copulatory organs have not been investigated.

**FIGURES 1–10.** Morphological characters of the genus *Eunatalis*. (1) Head, lower surface (Scale bar 1 mm), (2) antennae (Scale bar 1 mm), (3) Pro- and mesothorax, lower surface (Scale bar 1 mm), (4) Metendosternite (Scale bar 1 mm), (5) Nodules of elytral punctuation, arrow indicates the basal seta (Scale bar 20 µm), (6) Protarsus, with spine, spur and pulvilli (Scale bar 1 mm), (7) Wing venation (Scale bar 5 mm), (8) Longitudinal groove between eyes of *E. ninae n. sp.* (Scale bar 1 mm), (9) Elytral punctuation with two lateral nodules, *E. foveata* (Scale bar 1 mm), (10) Elytral punctuation with two lateral nodules and one basal nodule, *E. pernodulosa n. sp.* (Scale bar 1 mm).

## Key to species

1	Elytral apices dentate .....	<i>spinicornis</i>
-	Elytral apices not dentate .....	2
2	Elytra smooth, with obsolete punctuation .....	<i>laevis</i>
-	Elytra with conspicuous punctuation .....	3
3	Submentum with four transverse foveae (Fig. 11) .....	<i>auricoma n. sp.</i>
-	Submentum without foveae (Fig. 1) .....	4
4	Head with a short, longitudinal groove between eyes (Fig. 8) .....	<i>ninae n. sp.</i>
-	Head without groove .....	5
5	Elytral punctuation with only two lateral nodules (Fig. 9) .....	6
-	Elytral punctuation with two lateral and one basal nodule (Fig. 10) .....	7
6	Smaller species (19–26 mm), pronotal disc almost impunctate, pronotum with very distinct and very deeply separated wrinkles, procoxal cavities mostly closed .....	<i>foveata n. sp.</i>
-	Larger species (24–46 mm), pronotal disc with isolated fine punctuation, pronotum coarsely wrinkled, procoxal cavities mostly open .....	<i>titana</i>
7	Diameter of elytral punctuation almost equal towards apex .....	<i>villosa n. sp.</i>
-	Diameter of elytral punctuation decreasing towards apex .....	8
8	Elytra very long (elytral length:width ratio > 2.9:1) .....	9
-	Elytra shorter (elytral length:width ratio < 2.9:1) .....	11
9	Elytra sub-parallel, sides of pronotum with wrinkles and coarse punctuation .....	10
-	Elytra broader behind middle, sides of pronotum with conspicuous wrinkles .....	<i>schoopii n. sp.</i>
10	Punctuation of 9 <sup>th</sup> stria distinct from middle towards apex, mesepisternum smooth .....	<i>porcata</i>
-	Punctuation of 9 <sup>th</sup> stria vestigial, mesepisternum conspicuously punctate .....	<i>debilis</i>
11	Interocular space about one eye width (as viewed from above) .....	12
-	Interocular space conspicuously more than one eye width (as viewed from above) .....	15
12	Mesotibiae almost straight .....	<i>semitostata</i>
-	Mesotibiae bent .....	13
13	Elytra long (elytral length:width ratio > 2.7:1) .....	<i>integra</i>
-	Elytra shorter (elytral length:width ratio < 2.5:1) .....	14
14	Pronotum conspicuously sinuate laterally, elytral punctuation reaching apex .....	<i>laevicollis</i>
-	Pronotum not conspicuously sinuate laterally, elytral punctuation not reaching apex .....	<i>lugubris</i>
15	Elytra long (elytral length:width ratio > 2.7:1) .....	16
-	Elytra shorter (elytral length:width ratio < 2.7:1) .....	17
16	Pronotum long (pronotal length:width ratio > 1.12:1) .....	<i>planipennis</i>
-	Pronotum shorter (pronotal length:width ratio < 1.08:1) .....	<i>flavopilosa n. sp.</i>
17	Pronotum long (length:width ratio > 1.10:1) .....	18
-	Pronotum short (length:width ratio about 1.06:1) .....	19
18	Sides of pronotum conspicuously sinuate, with conspicuous wrinkles laterally, elytral punctuation not reaching apex .....	<i>mastersii</i>
-	Sides of pronotum not conspicuously sinuate, without conspicuous wrinkles laterally, elytral punctuation almost reaching apex .....	<i>hirta</i>
19	Nodules of elytra (especially laterally) conspicuously emarginate .....	<i>pernodulosa n. sp.</i>
-	Nodules of elytra not conspicuously emarginate .....	20
20	Sides of pronotum strongly sinuate .....	<i>fasciata</i>
-	Sides of pronotum not strongly sinuate .....	21
21	Punctuation of 10 <sup>th</sup> stria extending almost towards apex .....	<i>punctata n. sp.</i>
-	Punctuation of 10 <sup>th</sup> stria extending shortly behind middle .....	<i>spadicea n. sp.</i>

### *Eunatalis auricoma* Gerstmeier & Seitner 2013, n. sp.

(Figures 11–12, 55A)

**Specimens examined:** Holotype ♀: Mt Finnigan, 850–950m, via Helenvale, N. Qld., 3–5 Dec 1970, Monteith, Thompson, Cook, Sheridan & Roberts (QM)

**Diagnosis:** This is one of the larger species, similar in size to *E. titana* and *E. laevis*. *E. auricoma n. sp.* differs from all species by the four transverse foveae on submentum, the extremely protruding deep wrinkles on the sides of the pronotum and the long yellow setae, especially of the thorax.

**Length:** (1 specimen measured) Total length: 39 mm.

**Head:** Black, scattered with yellowish pilosity, posterior part of clypeus densely vested with erect yellow setae; interocular space smaller than one eye width; punctuation very dense; epistomal suture distinct; submentum with four transverse foveae diverging anteriorly (Fig. 11).

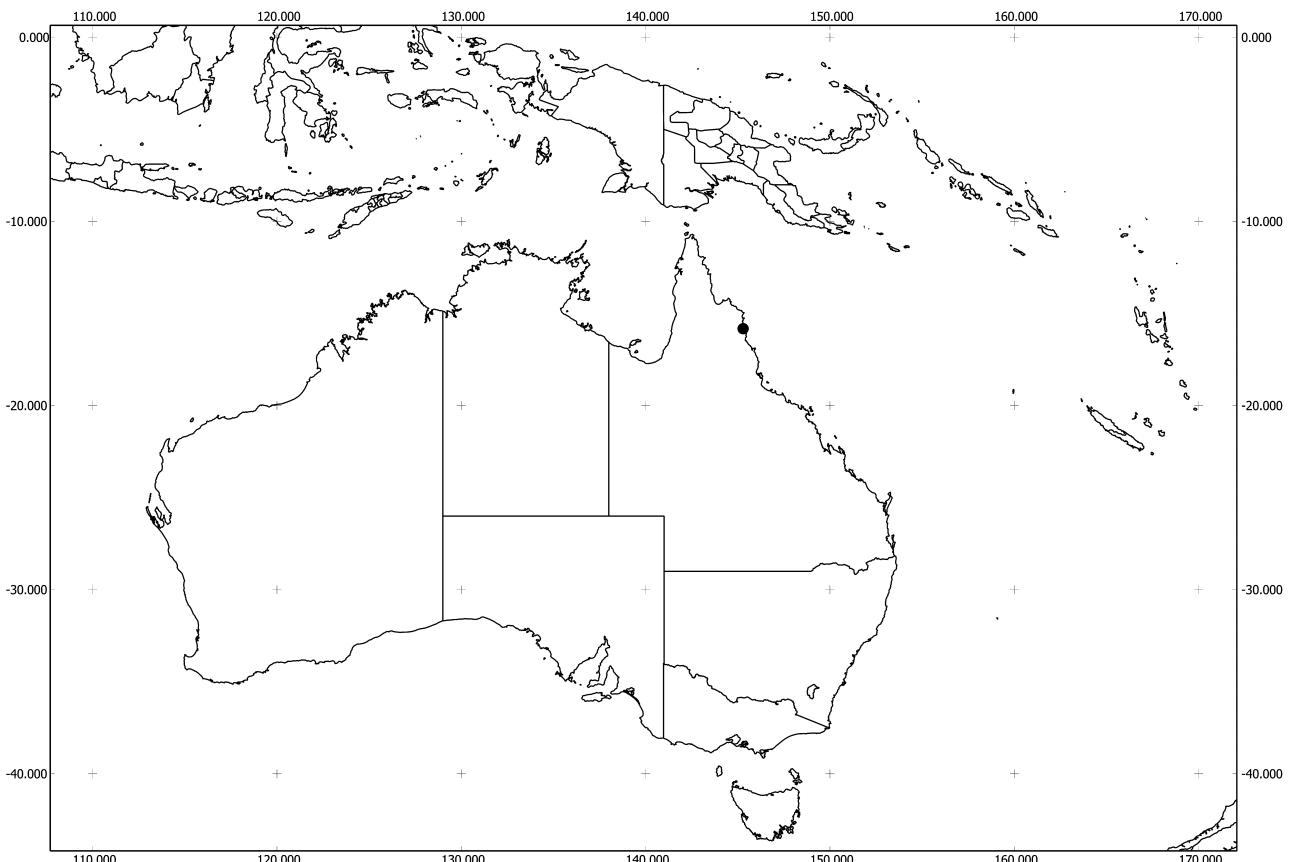

**FIGURE 11.** *Eunatalis auricoma* n. sp., head, lower surface, with four transverse foveae.

**Thorax:** Pronotal length to width ratio 1.07:1; pronotum black, vested with yellowish setae, laterally (in the middle) and at apex densely vested with golden-yellow setae, conspicuously constricted towards apex; sparsely punctate, sides with extremely protruding deep wrinkles; longitudinal groove slightly developed (short and shallow), grooves of sub-basal collar fused. Scutellum dark brown to black, slightly punctate.

**Elytra:** Elytral length to width ratio 2.17:1; elytra black, with long isolated yellow setae; elytral base slightly broader than pronotum, broader behind the middle; punctuation circular to oblong, with two conspicuously protruding lateral nodules; in basal half as broad as interstices, behind the middle abruptly smaller, decreasing towards apex, punctations of tenth stria conspicuous to the middle; punctations of ninth stria vestigial; interstices weakly ridged, with conspicuous microsculpture.

**Lower surface:** Black, lightly vested with yellow pilosity; procoxal cavities wide open behind; posterior part of mesepisternum conspicuously shallow; metaventrite densely vested with yellow setae in the middle.

**FIGURE 12.** Distribution of *Eunatalis auricoma* n. sp.

**Legs:** Black, densely vested with yellow setae, especially inner edges; finely wrinkled; mesotibiae slightly bent.

**Distribution:** Only known from type locality, Mt. Finnigan, Northern Queensland.

**Seasonal occurrence:** Collected in December.

**Etymology:** The specific epithet, *auricoma*, a Latin adjective refers to the golden-yellow pilosity, especially that of the thorax.

### ***Eunatalis debilis* (Blackburn, 1900)**

(Figures 13–14, 55B)

*Natalis debilis* Blackburn, 1900: 120.

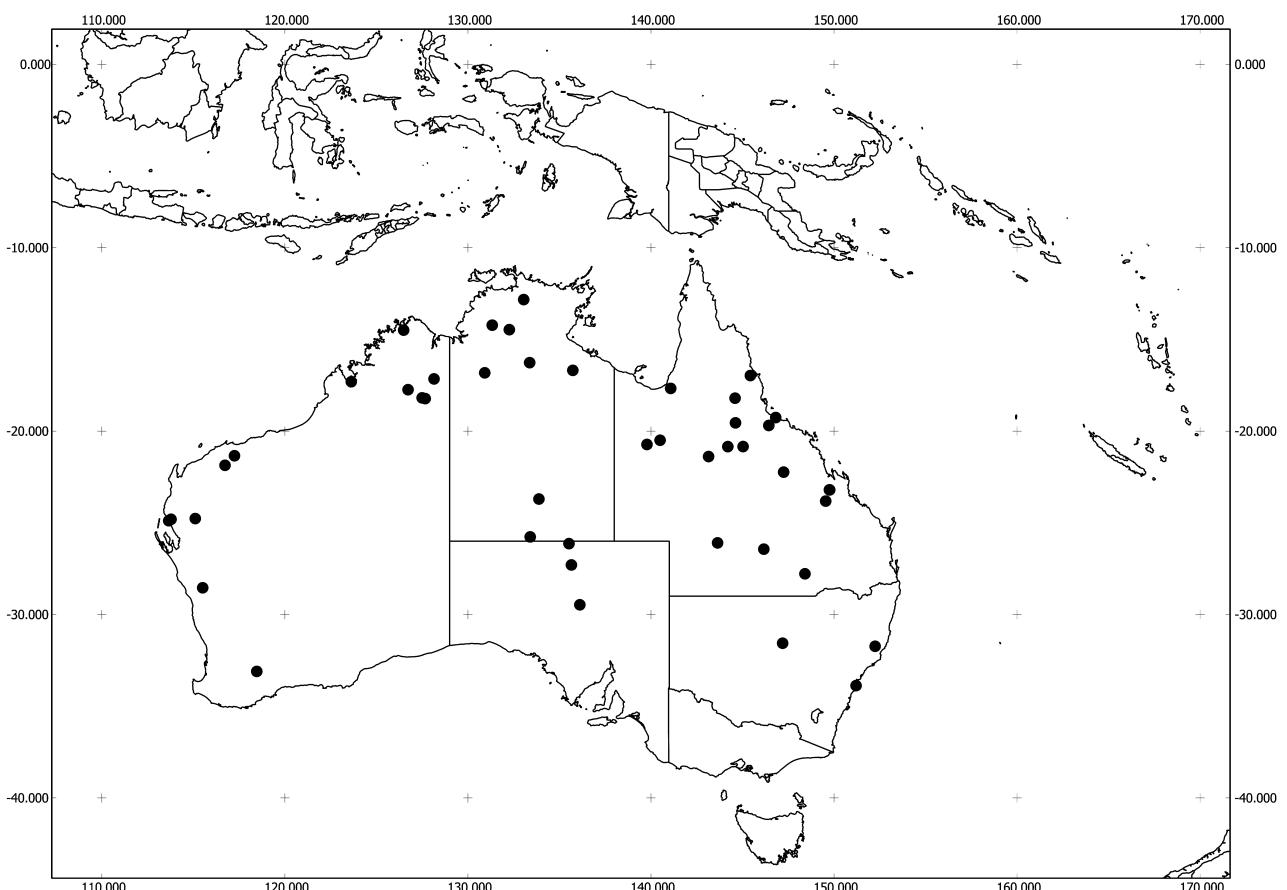

**Specimens examined: Holotype:** *Natalis debilis*, Blackb.; Australia, Blackburn Coll. B.M. 1910 – 236.; 6725 T, Lyndhurst. (TYPE) (BMNH).

**Comment on the type specimen:** In stating "the specimen before me", Blackburn (1900: 121) implied that the nominal species-group taxon, *Natalis debilis*, was based on a single specimen. The 'type' located in the Natural History Museum, London (BMNH) is therefore considered the holotype, fixed by monotypy (ICZN 1999: Article 73.1.2).

**Others:** Minnie Downs, N.E. Corner of S. Aust., L. Reeve; 25-035981 (SAMA). M. 1488; O-166963 (QDPC). Qld., Greenvale, 70 km SW, at light, A.J. **Diagnosis:** *E. debilis* is clearly recognizable by the extended pronotum and elytra, similar those of *E. porcata* and *E. schopfi n. sp.* *E. debilis* differs from all other species by the strongly punctate posterior part of the mesepisternum.

**Length:** (73 specimens measured) Total length: 14–17 mm.

**Head:** Black, with isolated pilosity; with dense punctuation; epistomal suture inconspicuous; interocular space more than 1.5 eye width.

**Thorax:** Pronotal length to width ratio 1.17:1; pronotum black, dorsally and laterally with dense punctuation; conspicuously longer than wide, more or less sinuate behind the base, wrinkles weak; grooves of sub-basal collar conspicuously separated by a wide, distinct bar. Scutellum dark brown to black.

**Elytra:** Elytral length to width ratio 3.06:1; elytra dark brown to black, in part with a transverse reddish fascia; elytral base as wide as or wider than pronotum, lateral margins subparallel; diameter of punctations as wide as interstices, punctuation of equal diameter in basal and apical half; punctations of tenth stria conspicuous almost towards apex; elytral punctuation with three nodules; interstice 4, 5 and 6 weakly ridged, interstices with conspicuous microsculpture.

**Lower surface:** Dark brown to black, with dense pilosity; procoxal cavities almost closed; posterior part of mesepisternum punctate; metaventrite with dense punctuation and weak wrinkles.

**Legs:** Black, with isolated pilosity, with dense punctuation and fine wrinkles; mesotibiae bent.

**Abdomen:** Tegmen opened ventrally, phallobasic apodeme terminating straight; spicular fork fused to two-third, dilated triangularly.

**Distribution:** Australia, mainly northern and south-eastern parts.

**Seasonal occurrence:** Collected from July to April.

### ***Eunatalis fasciata* (Blackburn, 1890)**

(Figures 15–16, 55C)

*Natalis fasciata* Blackburn, 1890: 125; Blackburn 1899: 30, 33.

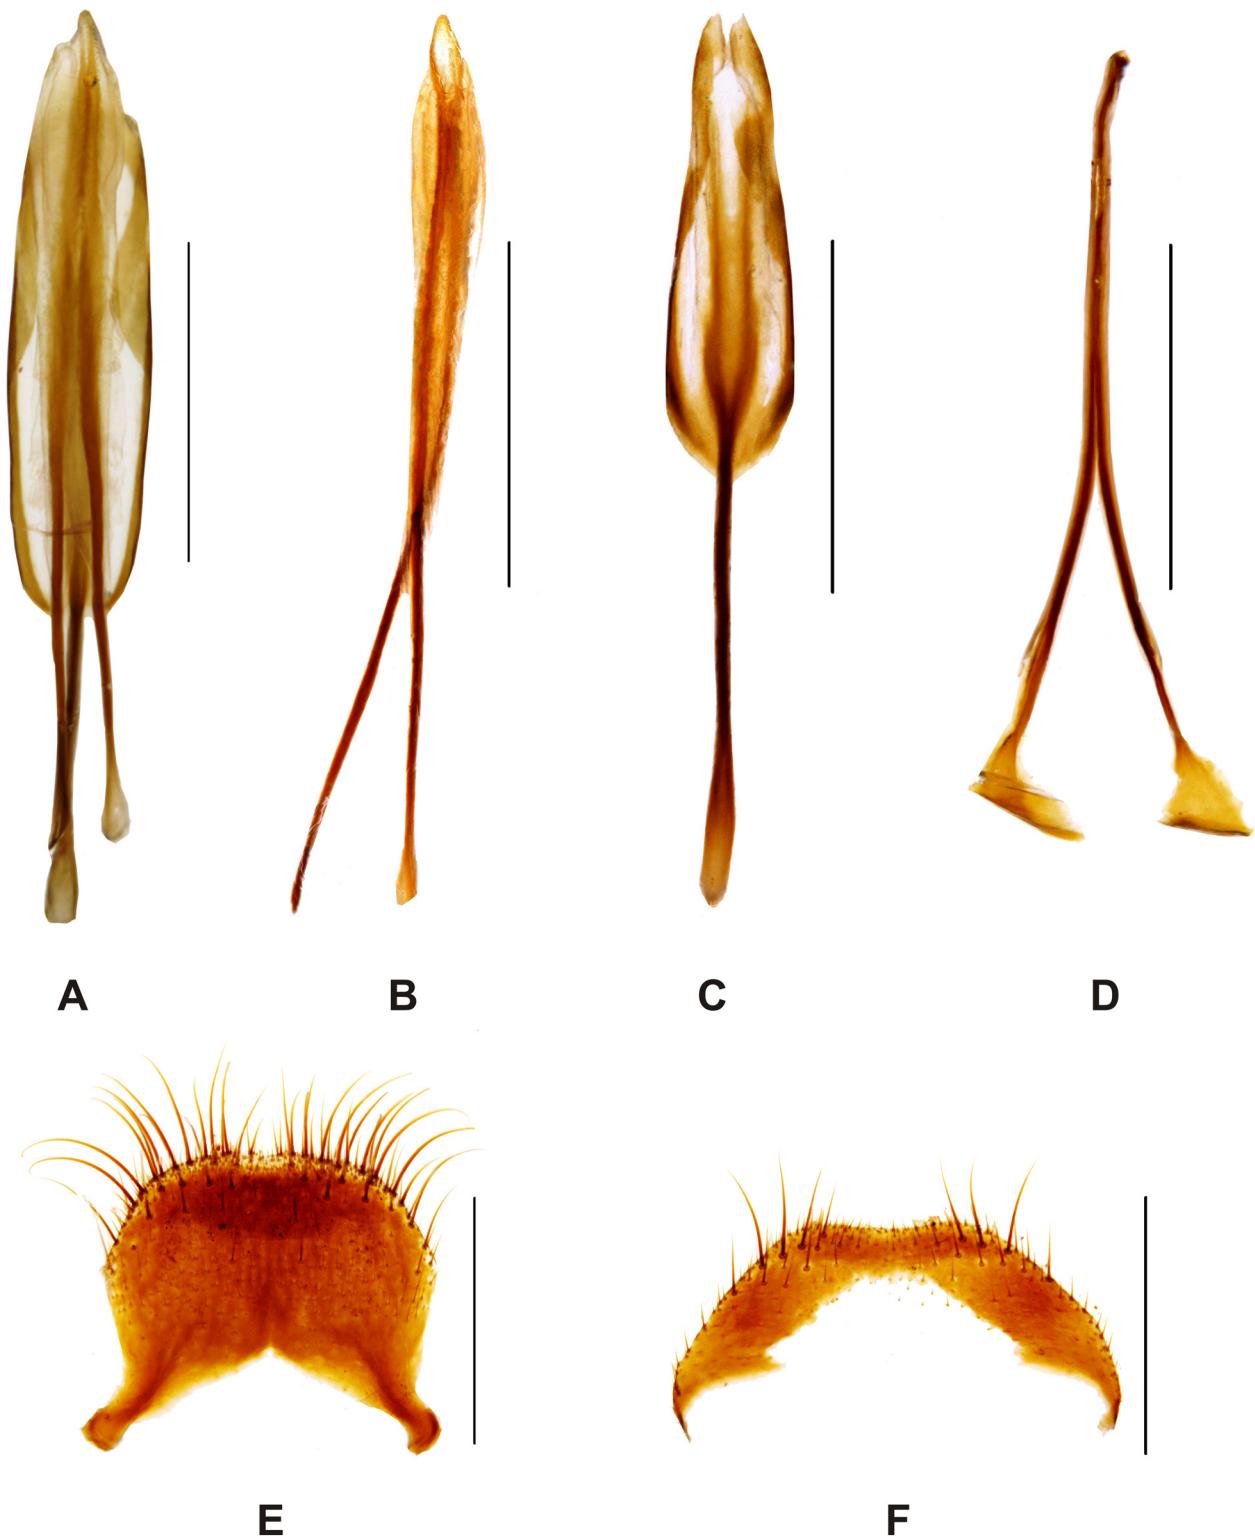

**Specimens examined: Lectotype** (designated here): Type, 500, P. Linc. T.; Australia, Blackburn Coll., B.M. 1910-236; *Natalis fasciata*, Blackb. (BMNH).

**Comment on the type specimen:** Blackburn (1890: 125, 126) referred separately to three specimens but neglected to fix any one of them as the holotype. The specimen labelled 'type' located in the Natural History Museum, London (BMNH) is therefore considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1). Should additional syntypes be discovered, they may be designated as paralectotypes.

**Diagnosis:** The pronotum being strongly sinuate behind the middle and the elytra with a lighter transverse fascia and more-or-less rounded apices are characteristic of *E. fasciata*.

**Length:** (54 specimens measured) Total length: 10–22 mm.

**FIGURE 15.** *Eunatalis fasciata*: (A) Aedeagus ventral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

**Head:** Dark brown to black, with isolated pilosity; with dense punctation and fine wrinkles; epistomal suture conspicuous; interocular space between one and 1.5 eye width.

**Thorax:** Pronotal length to width ratio 1.06:1; thorax light brown to dark brown, with isolated pilosity, dense punctation with large and small punctures, laterally with conspicuously protruding wrinkles; strongly sinuate

behind middle, base more or less constricted; grooves of sub-basal collar separated by a bar. Scutellum dark brown, with slight punctuation.

**Elytra:** Elytral length to width ratio 2.67:1; elytra light brown to dark brown or black, with a more or less lighter transverse fascia; with isolated pilosity; elytral base slightly broader than pronotum, broader behind the middle; apex more or less rounded, partly straight; diameter of punctations in basal half slightly wider than interstices, decreasing towards apex; punctations of tenth stria conspicuous up to just behind middle, sometimes conspicuous just before apex; punctations of ninth stria vestigial; elytral punctation with three nodules; interstices 2 and 4 conspicuously ridged just behind the elytral base, interstices 6 and 8 ridged behind the middle; interstices with microsculpture.

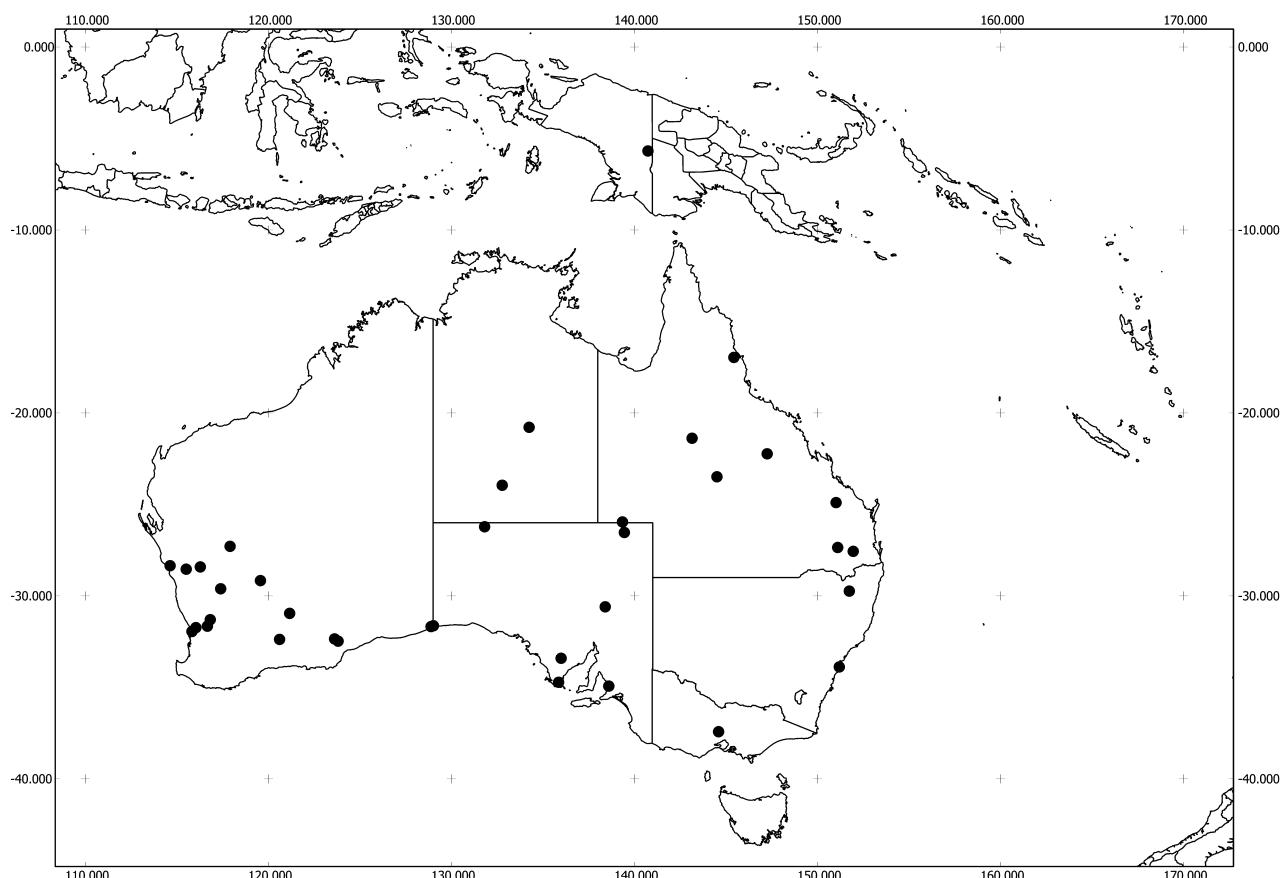

**Lower surface:** Light brown to dark brown, with isolated pilosity; procoxal cavities slightly opened to closed posteriorly; with more or less weak punctuation; metaventrite partly finely wrinkled.

**Legs:** Dark brown, with dense pilosity, with dense punctuation and fine wrinkles; mesotibiae conspicuously bent.

**Abdomen:** Tegmen opened ventrally and laterally; spicular fork fused halfway, processes dilated triangularly.

**Distribution:** Whole Australia.

**Seasonal occurrence:** Collected from July to January.

**FIGURE 16.** Distribution of *Eunatalis fasciata*.

**Diagnosis:** *E. flavopilosa* n. sp. differs from all other species by the yellowish pilosity of the pronotum. The phallic tip has a slightly bent, hook-like structure.

**Length:** (149 specimens measured) Total length: 11–18 mm.

**Head:** Red-brown or dark brown to black, with more or less depressed yellowish pilosity; with dense punctuation and fine wrinkles; epistomal suture not distinct; interocular space broader than one eye width.

**Thorax:** Pronotal length to width ratio 1.04:1; pronotum red-brown or dark brown to black, with depressed yellowish pilosity; with weak punctuation, laterally conspicuously wrinkled, convergent towards apex; grooves of sub-basal collar distinct, separated by a bar. Scutellum dark brown to black, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.83:1; elytra red-brown or light brown to dark brown, with isolated white pilosity; elytral base only slightly wider than pronotum, towards apex subparallel to slightly broader; diameter of punctations in basal half wider than interstices, especially punctuation of striae 1 to 4 becoming smaller behind middle and almost decreasing, punctuation of striae 5 to 8 not decreasing so conspicuously, punctations of tenth stria

distinct just before apex; punctations of ninth stria vestigial; elytral punctuation with three nodules; interstices 4 and 6 weakly ridged behind the middle, the other flattened, without distinct microsculpture.

**Lower surface:** Red-brown or dark brown to black, with light, white pilosity; procoxal cavities slightly opened to closed posteriorly.

**FIGURE 17.** *Eunatalis flavopilosa* n. sp.: (A) Aedeagus ventral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

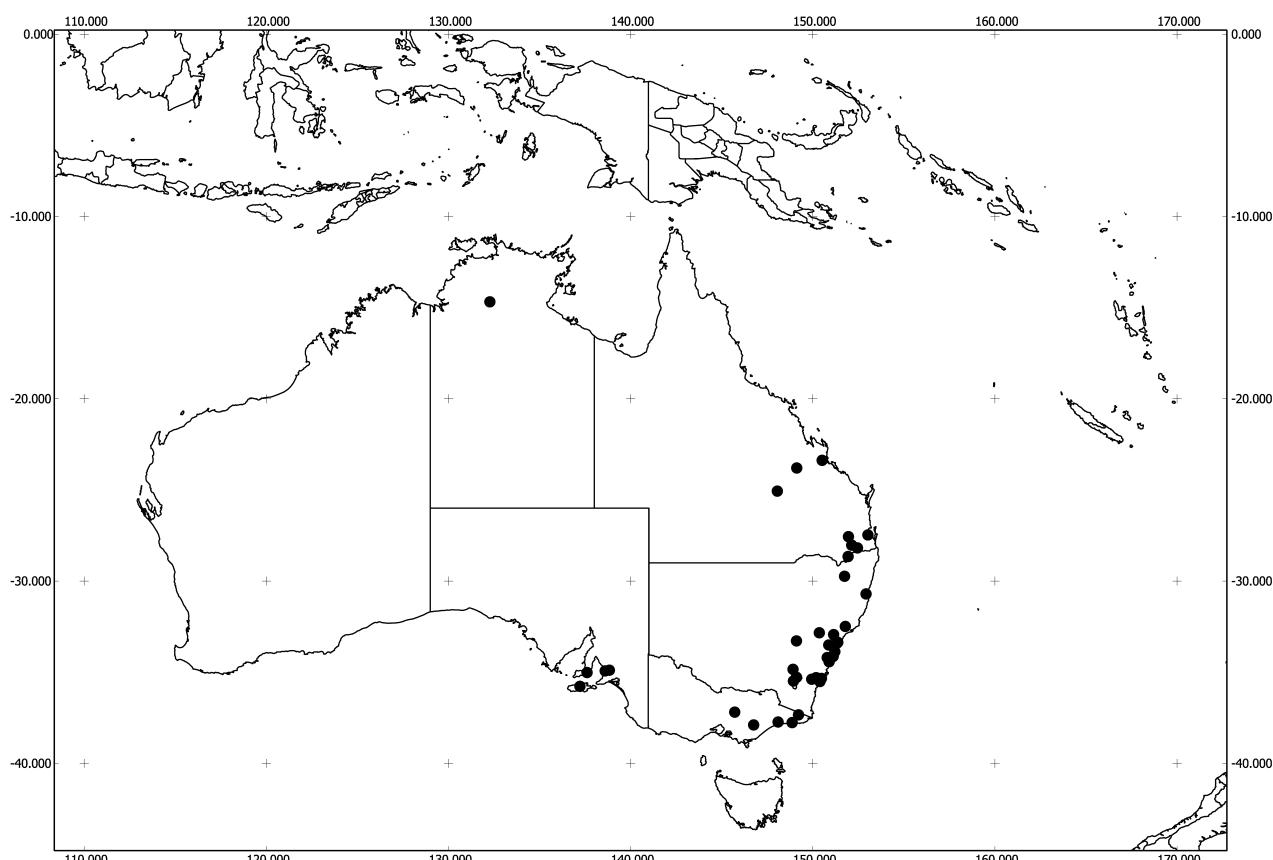

**Legs:** Light brown to dark brown, with dense, white pilosity; with weak punctuation and fine wrinkles; mesotibiae bent.

**Abdomen:** Tegmen closed ventrally; phallus tip with a slightly bent, hook-like structure; spicular fork fused less than one-sixth.

**Distribution:** Australia, east coast and region around Adelaide.

**Seasonal occurrence:** Collected from September to May.

**Etymology:** The specific epithet, *flavopilosa*, a Latin adjective refers to the whitish pilosity, especially that of the pronotum.

**FIGURE 18.** Distribution of *Eunatalis flavopilosa* n. sp.

***Eunatalis foveata* Gerstmeier & Seitner 2013, n. sp.**

(Figures 9, 19–20, 55E)

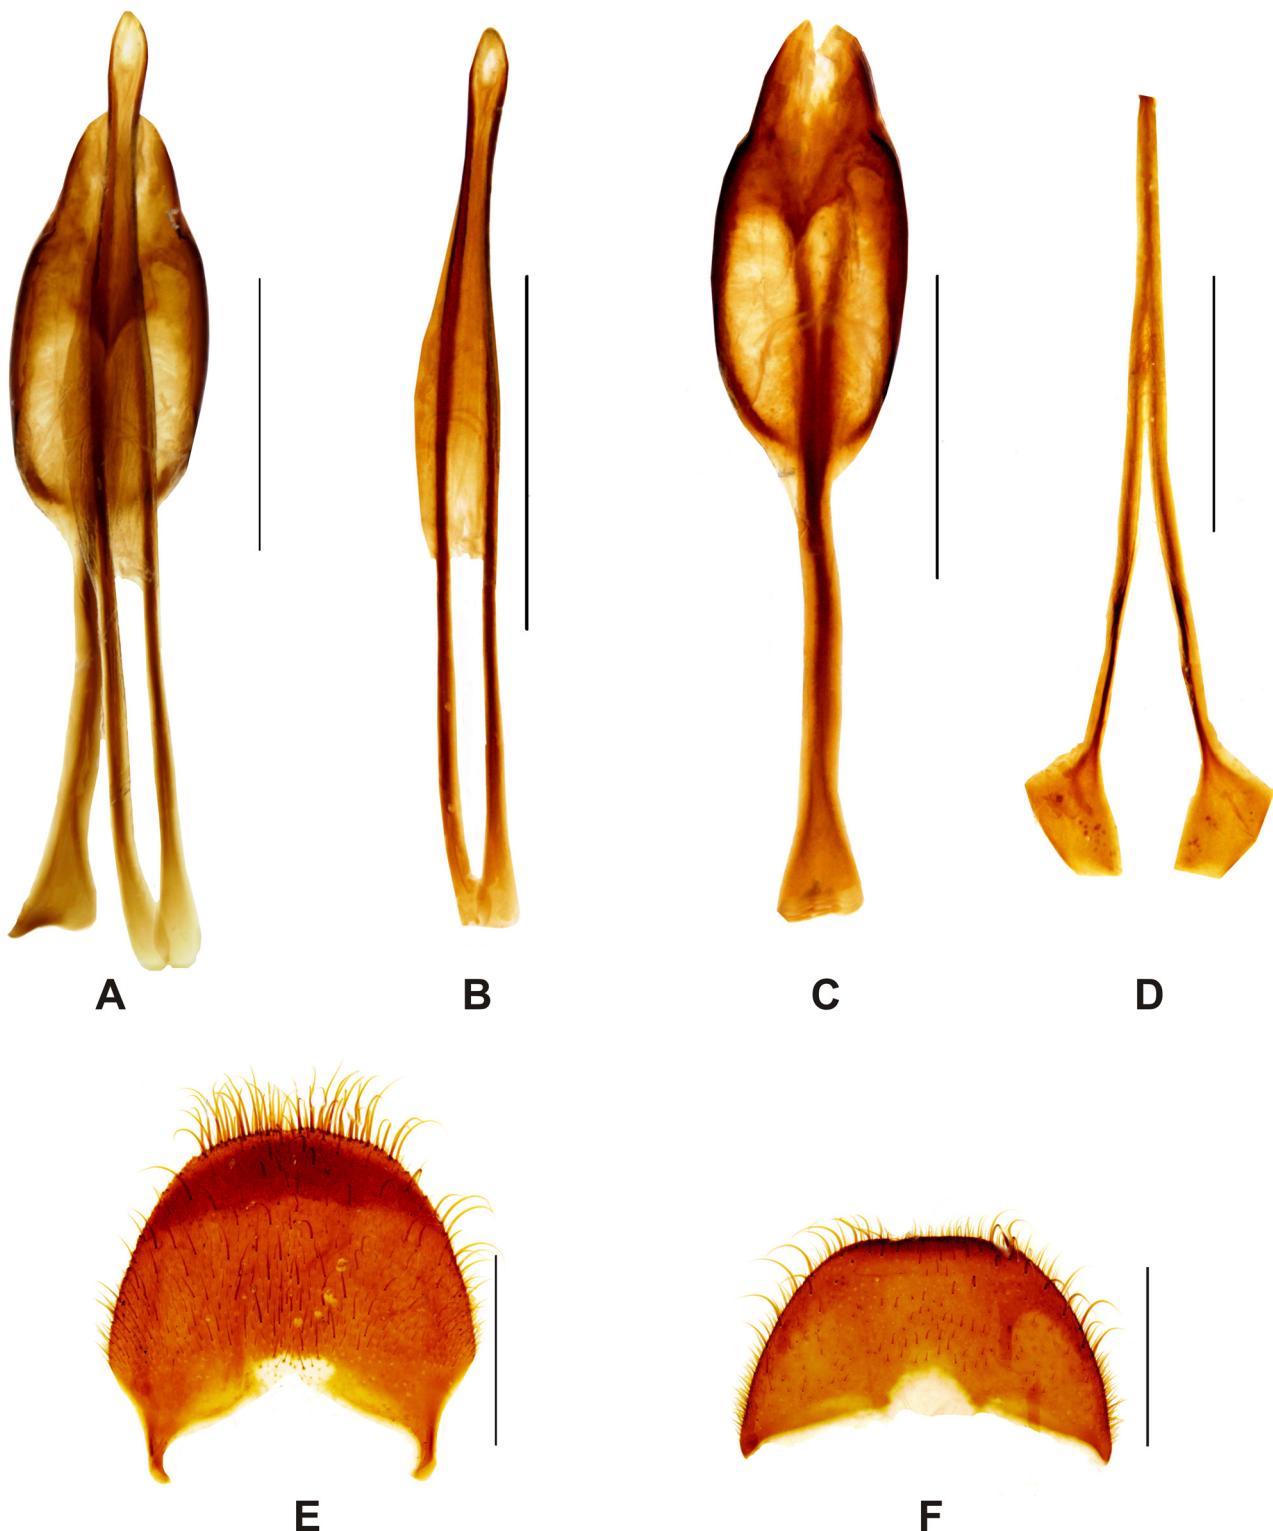

**Specimens examined: Holotype:** Qld: 26.24Sx150.817E, Barakula SF, site 8, 424m, 1–15 Dec 2009, Malaise, Monteith & Turco 19187 (QM).

**Paratypes:** Yurraman, A.R.B., 11.47; O-166569, 4 ex. (QDPC). N. Galles, du Sud, Richmond River, 2 ex. (MNHN/RGCM). Milmerran, Q., MacQueen (ANIC). May. 13; Nov. Holl., Queensld. (MNHN). N.S. Wales (MNHN). Queensland 85.44 (BMNH). Swans Rd., Bruxner Pk, Flora RES., N.E. NSW, 30°14'S 150°8'E, 14 Nov 1983, ABRS, AM/AM. RF. (QM).

**Diagnosis:** Besides *E. titana*, this is the only species with only two lateral nodules in elytral punctuation. Other than its larger size, *E. foveata* n. sp. by the distinct transverse convexity of the mesoventrite.

**Length:** (15 specimens measured) Total length: 19–26 mm.

**Head:** Black, with isolated pilosity; sparsely covered with small and large punctures, with extremely fine microsculpture; epistomal suture distinct; interocular space about one eye width.

**FIGURE 19.** *E. foveata* n. sp.: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

**Thorax:** Pronotal length to width ratio 1.08:1; pronotum black, with isolated pilosity, impunctate, sides of pronotum strongly and deeply wrinkled; grooves of sub-basal collar distinct, fused. Scutellum dark brown to black, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.33:1; elytra dark brown to black, with isolated pilosity; elytral base as wide as pronotum, broader behind the middle; elytral punctuation not reaching apex; punctations in basal half as wide as interstices, abruptly smaller behind middle and decreasing, punctations of striae 7 and 8 partly decreasing

just before apex, punctations of tenth striae distinct almost up to middle; punctations of ninth striae vestigial; elytral punctuation with two conspicuously protruding lateral nodules (without basal nodules); interstices 4 weakly ridged just behind base, interstices 6 and 8 weakly ridged behind middle, interstices with extremely fine microsculpture.

**Lower surface:** Dark brown to black, with isolated pilosity; procoxal cavities distinctly closed behind; metaventrite with weak punctuation and wrinkles.

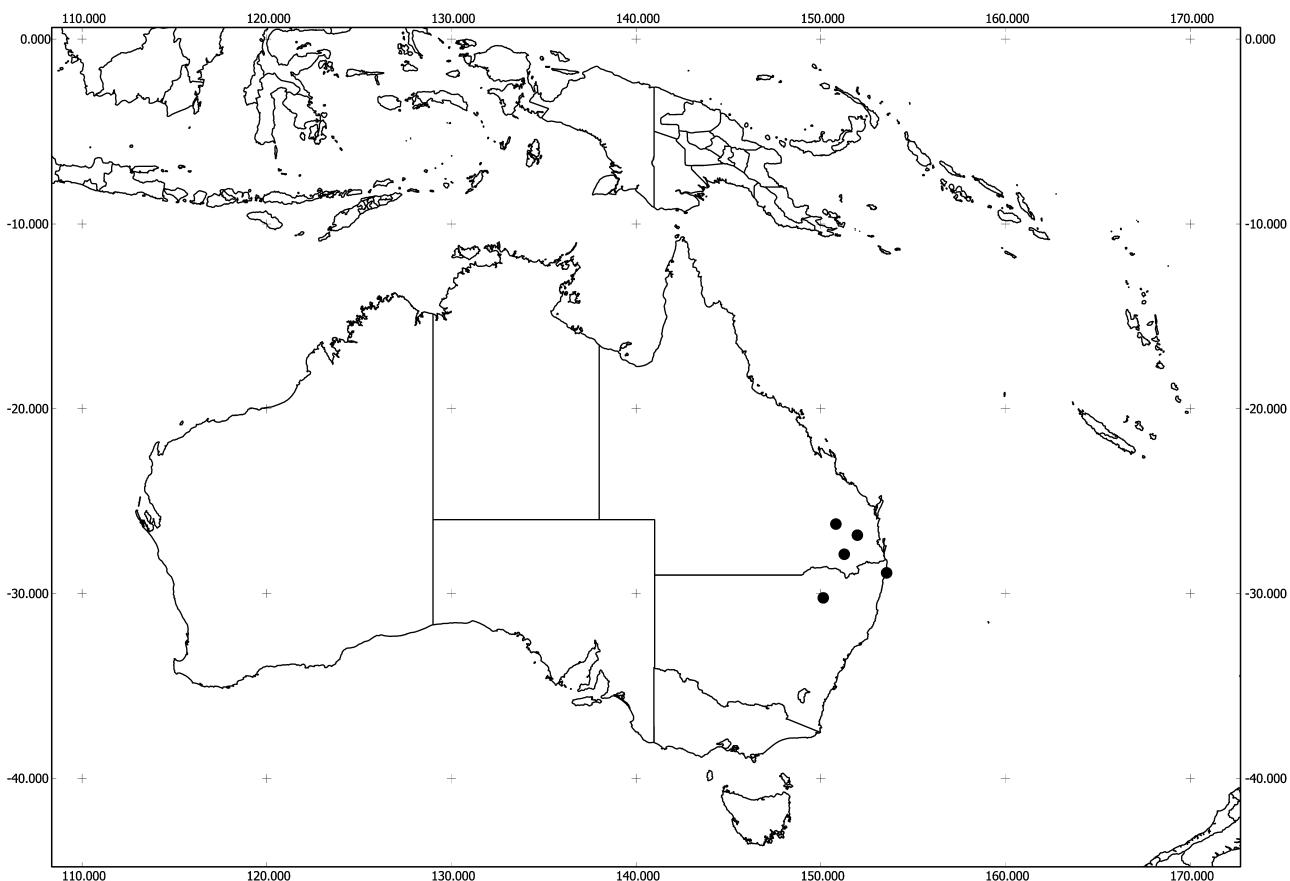

**Legs:** Black, with dense pilosity, especially at inner edge; with dense punctuation and fine wrinkles; mesotibiae bent.

**Abdomen:** Tegmen closed ventrally and conspicuously dilated; spicular fork fused to one-third.

**Distribution:** In the south-eastern part of Queensland and the most northern part of New South Wales.

**Seasonal occurrence:** Collected in May, November and December.

**Etymology:** The specific epithet, *foveata*, a Latin adjective refers to the strong wrinkles at pronotal sides.

**FIGURE 20.** Distribution of *Eunatalis foveata* n. sp.

#### *Eunatalis hirta* (Blackburn, 1890)

(Figures 21–22, 55F)

*Natalis hirta* Blackburn, 1890: 122; Blackburn 1899: 30.

*Eunatalis longicollis* (Blackburn, 1890): 126; Blackburn 1899: 29 **n. syn.**

**Specimens examined:** *Natalis hirta*: **Lectotype** (designated here): Type; Australia, Blackburn Coll., B.M. 1910-236; 3499T; *Natalis hirta* (♂, BMNH). **Paralectotype** (designated here): Israelite Bay; *Natalis hirta* Blackb, co-type; *Natalis hirta*, Blkb, ?W Australia; 25-035778 (SAMA).

*Natalis longicollis*: **Lectotype** (designated here): Type; 3445 Ad; Australia, Blackburn Coll., B.M. 1910-236; *Natalis longicollis* Blackb. (♂, BMNH). **Paralectotype** (designated here): *Natalis longicollis*, S. Australia, 9588 Cotype; S. Australia; 25-035800 (SAMA).

**Comment on the type specimens:** As Blackburn (1890) made no reference to type specimens in his descriptions of *Natalis hirta* and *N. longicollis*, all 'type' material for these nominal species-group taxa should be treated as syntypes (ICZN 1999: Article 73.2) and, as such, are available for lectotype designation (ICZN 1999: Article 74.1). Following Recommendation 74D (ICZN 1999) we have designated the BMNH syntypes as lectotypes because the majority of Blackburn's types are held in that institution (Lea 1912). Syntypes borrowed from SAMA were designated as paralectotypes.

**Others:** W. Australia; *Natalis hirta* Blackb, S. Schenckling det; Homotype, *Eunatalis hirta* Blackburn (BMNH). Ex Musaeo H.W. Bates 1892 (MNHN). East Hyden, 10-2-73 WA (ANIC). **Diagnosis:** As indicated by Blackburn (1890), the 2<sup>nd</sup>, 4<sup>th</sup> and 6<sup>th</sup> elytral interstices are charactistically ridged in *E. hirta*; as is the 8<sup>th</sup> interstice being conspicuously ridged behind the middle. The phallic tip has an open Z-shaped structure and less than one-fifth of the spicular fork is fused.

**Length:** (171 specimens measured) Total length: 10-29 mm.

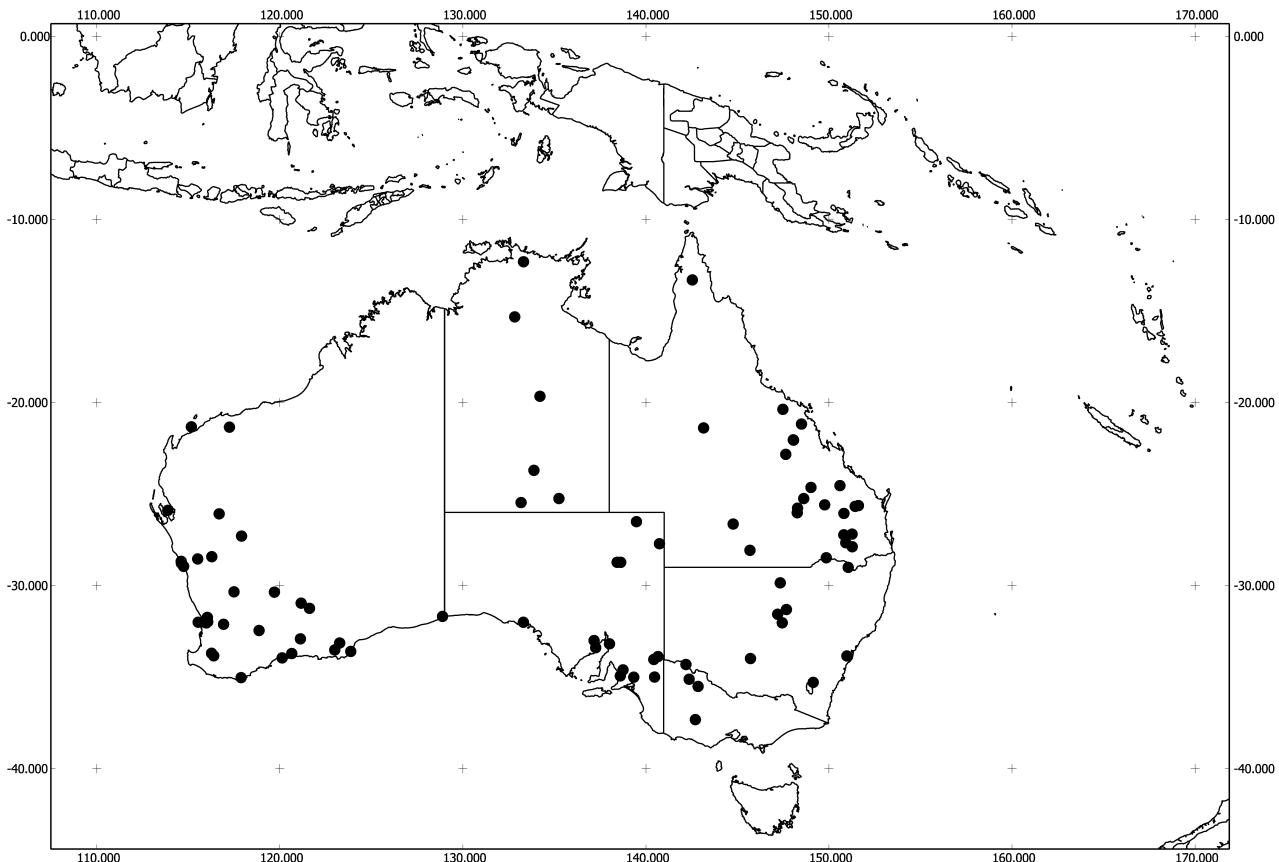

**Head:** Dark brown to black, with dense pilosity; densely punctated with small punctures and isolated large punctures; epistomal suture more or less conspicuous; interocular space about 1.5 to double eye width.

**Thorax:** Pronotal length to width ratio 1.12:1; pronotum light brown to dark brown, with dense pilosity, with dense and small punctuation and isolated large punctuation; inconspicuously wrinkled; widest anterior to middle, slightly convergent towards apex; grooves of sub-basal collar separated by a conspicuous, wide bar. Scutellum light brown to dark brown, with weak punctuation and isolated pilosity.

**Elytra:** Elytral length to width ratio 2.64:1; elytra light brown to dark brown, with dense greyish pilosity; elytral base slightly broader than pronotum, broader behind middle; punctations in basal half as wide as interstices, becoming only slightly smaller behind middle; elytral punctuation with three nodules; punctations of tenth stria distinct just before apex; punctations of ninth stria vestigial; interstices 2 slightly, interstices 4 and 6 just shortly behind middle and interstices 8 behind middle conspicuously ridged.

**FIGURE 21.** *E. hirta*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrite VI.

**FIGURE 22.** Distribution of *Eunatalis hirta*.

**Lower surface:** Light brown to dark brown, with dense pilosity; procoxal cavities slightly opened to closed posteriorly; mesoventrite and metaventrite with dense punctuation; posterior part of mesepisternum smooth.

**Legs:** Light brown to dark brown, with dense pilosity and dense punctuation; mesotibiae conspicuously bent.

**Abdomen:** Tegmen closed ventrally; phallus tip with an open Z-shaped structure; spicular fork fused less than one-fifth.

**Distribution:** Australia.

**Seasonal occurrence:** Collected the whole year.

**Remarks:** *E. longicollis* was synonymized with *E. hirta* because there were no differences in the aedeagi, pygidia and 6<sup>th</sup> ventrites. Within the species there is a conspicuous variability regarding the pronotum, distinctness of the elytral punctuation in the apical half, and of the pilosity. As Blackburn described in 1890, the ridged interstices 2, 4 and 6 are particular.

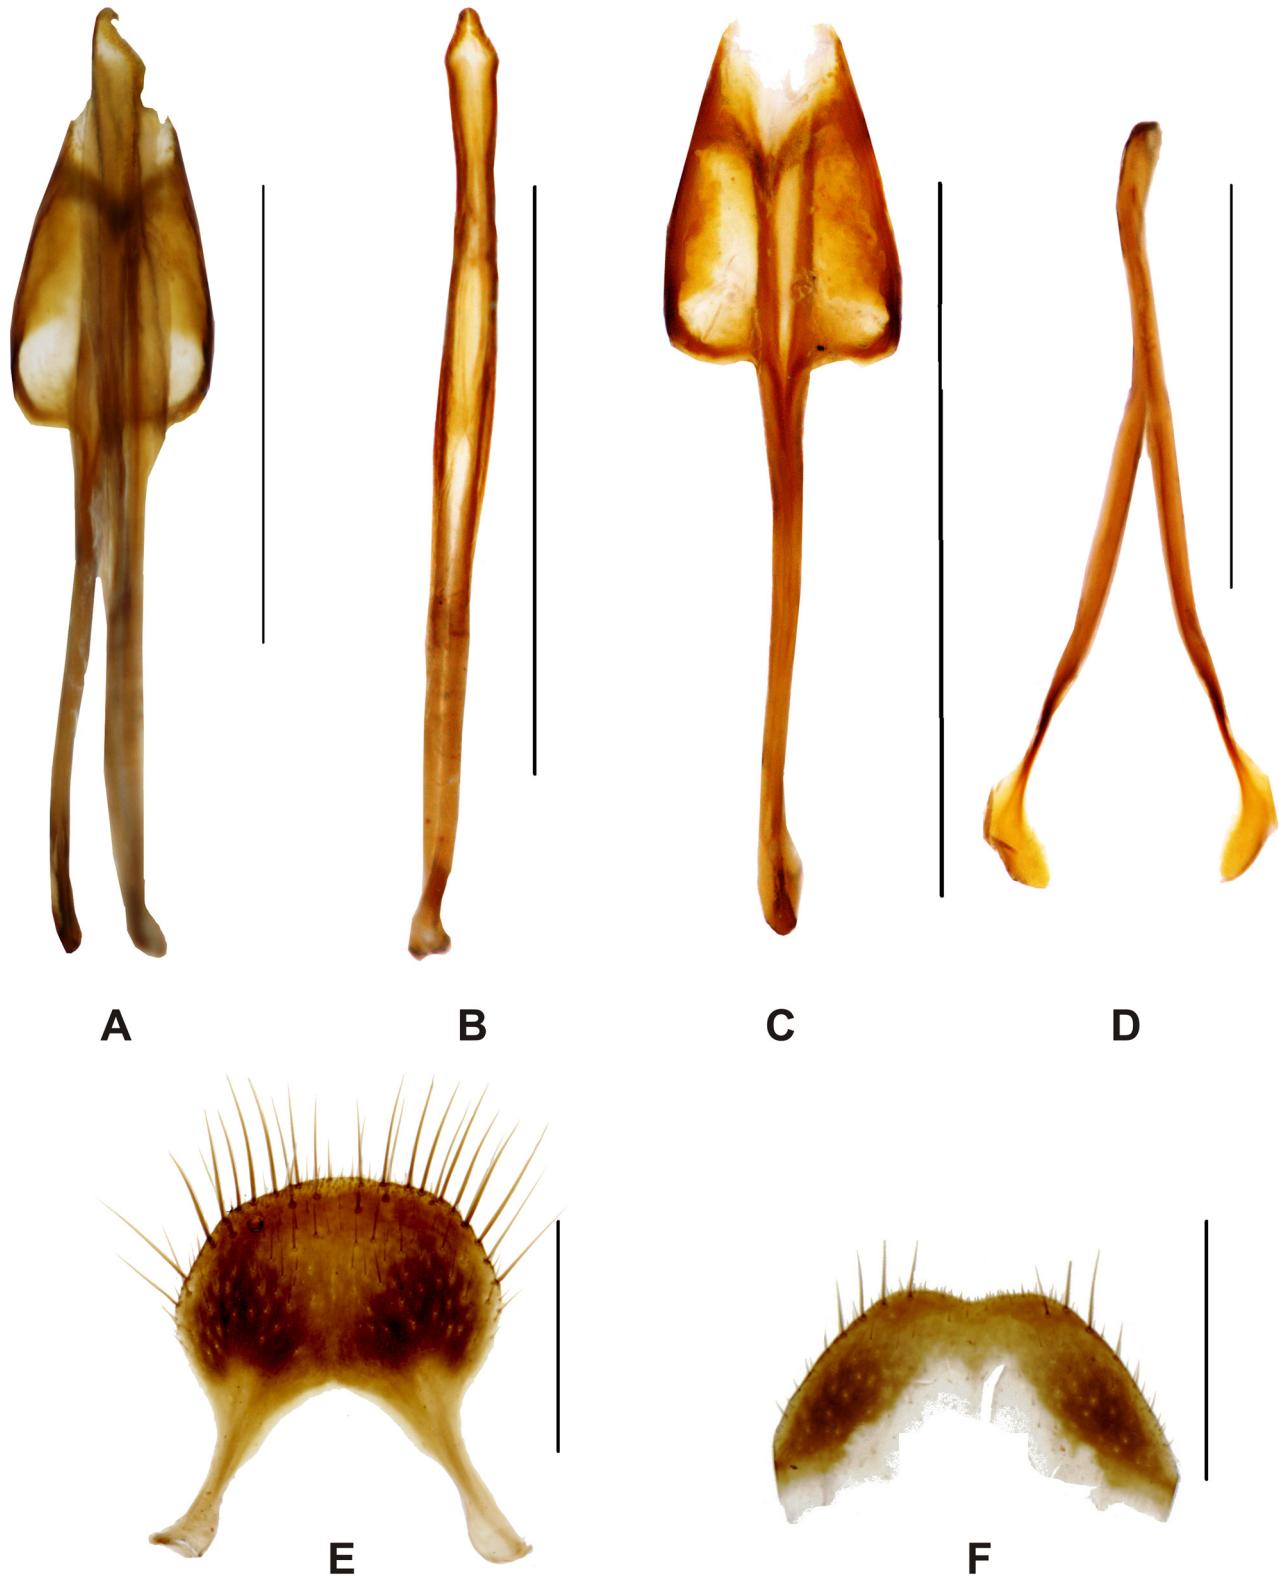

#### ***Eunatalis integra* (Blackburn, 1899)**

(Figures 23–24, 56A)

*Natalis integra* Blackburn, 1899: 29, 30.

**Specimens examined: Holotype:** *Natalis integra*, Blackb.; Australia, Blackburn Coll., B.M. 1910 – 236; 6393 Euc. T. (TYPE) (BMNH).

**Comment on the type specimen:** Blackburn (1899: 31) mentioned two specimens; one he referred to as "the type" plus a "second specimen taken near Adelaide", to which he did not allocate any type status. The type locality given after Blackburn's description is "S.Q. Australia (Eucla)". On one of the labels of the 'type' in the Natural History Museum, London (BMNH) "6393 Euc. T." is written; 'Euc' referring to the locality Eucla and 'T' referring to it being the type. As Blackburn referred to the Eucla specimen as "the type" within the original description, that specimen can therefore be considered the holotype, fixed by original designation (ICZN 1999, Article 73.1.1).

**FIGURE 23.** *Eunatalis integra*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

Ti-Tree N.T., 30/12/1982, D.P. Carne, At light (ANIC). Ooldea, S.A., A.M. Lea; 25-035834 (SAMA).

**Diagnosis:** *E. integra* is characterized by its relatively large eyes (the interocular space being smaller than one eye width) and the isolated transverse wrinkles along the longitudinal pronotal groove. The phallic tip is triangular with a small hook-like structure and the tegmen is very short.

**Length:** (52 specimens measured) Total length: 10–14 mm.

**Head:** Black, with isolated pilosity; with dense punctuation and wrinkles; epistomal suture distinct; eyes relatively large; interocular space smaller than one eye width.

**Thorax:** Pronotal length to width ratio 1.08:1; pronotum dark brown to black, with isolated pilosity, weak punctuation and laterally with distinct wrinkles, isolated transverse wrinkles along the longitudinal groove; grooves of sub-basal collar separated by a wide bar. Scutellum dark brown to black.

**FIGURE 24.** Distribution of *Eunatalis integra*.

**Elytra:** Elytral length to width ratio 2.76:1; elytra dark brown to black, with isolated pilosity; elytral base slightly wider than pronotum, broader behind middle, dorsally sinuate, apex rounded; punctations in basal half as wide as interstices, becoming smaller towards apex; elytral punctuation with three nodules (laterally distinct, basally very weak); punctations of tenth stria distinct up to shortly behind middle; punctations of ninth stria vestigial, sometimes distinct; interstices very weakly ridged, with distinct microsculpture; humeri distinct.

**Lower surface:** Dark brown, with isolated pilosity; procoxal cavities opened posteriorly; prosternal process lighter; metaventrite with weak wrinkles; posterior part of mesepisternum smooth.

**Legs:** Black, with isolated pilosity and weak wrinkles; mesotibiae bent.

**Abdomen:** Tegmen closed ventrally; phallic tip triangular, with hook-like structure; spicular fork fused halfway; pygidial processes conspicuously extended.

**Distribution:** Australia, Tasmania.

**Seasonal occurrence:** Collected from August to May.

### ***Eunatalis laevicollis* (Blackburn, 1899)**

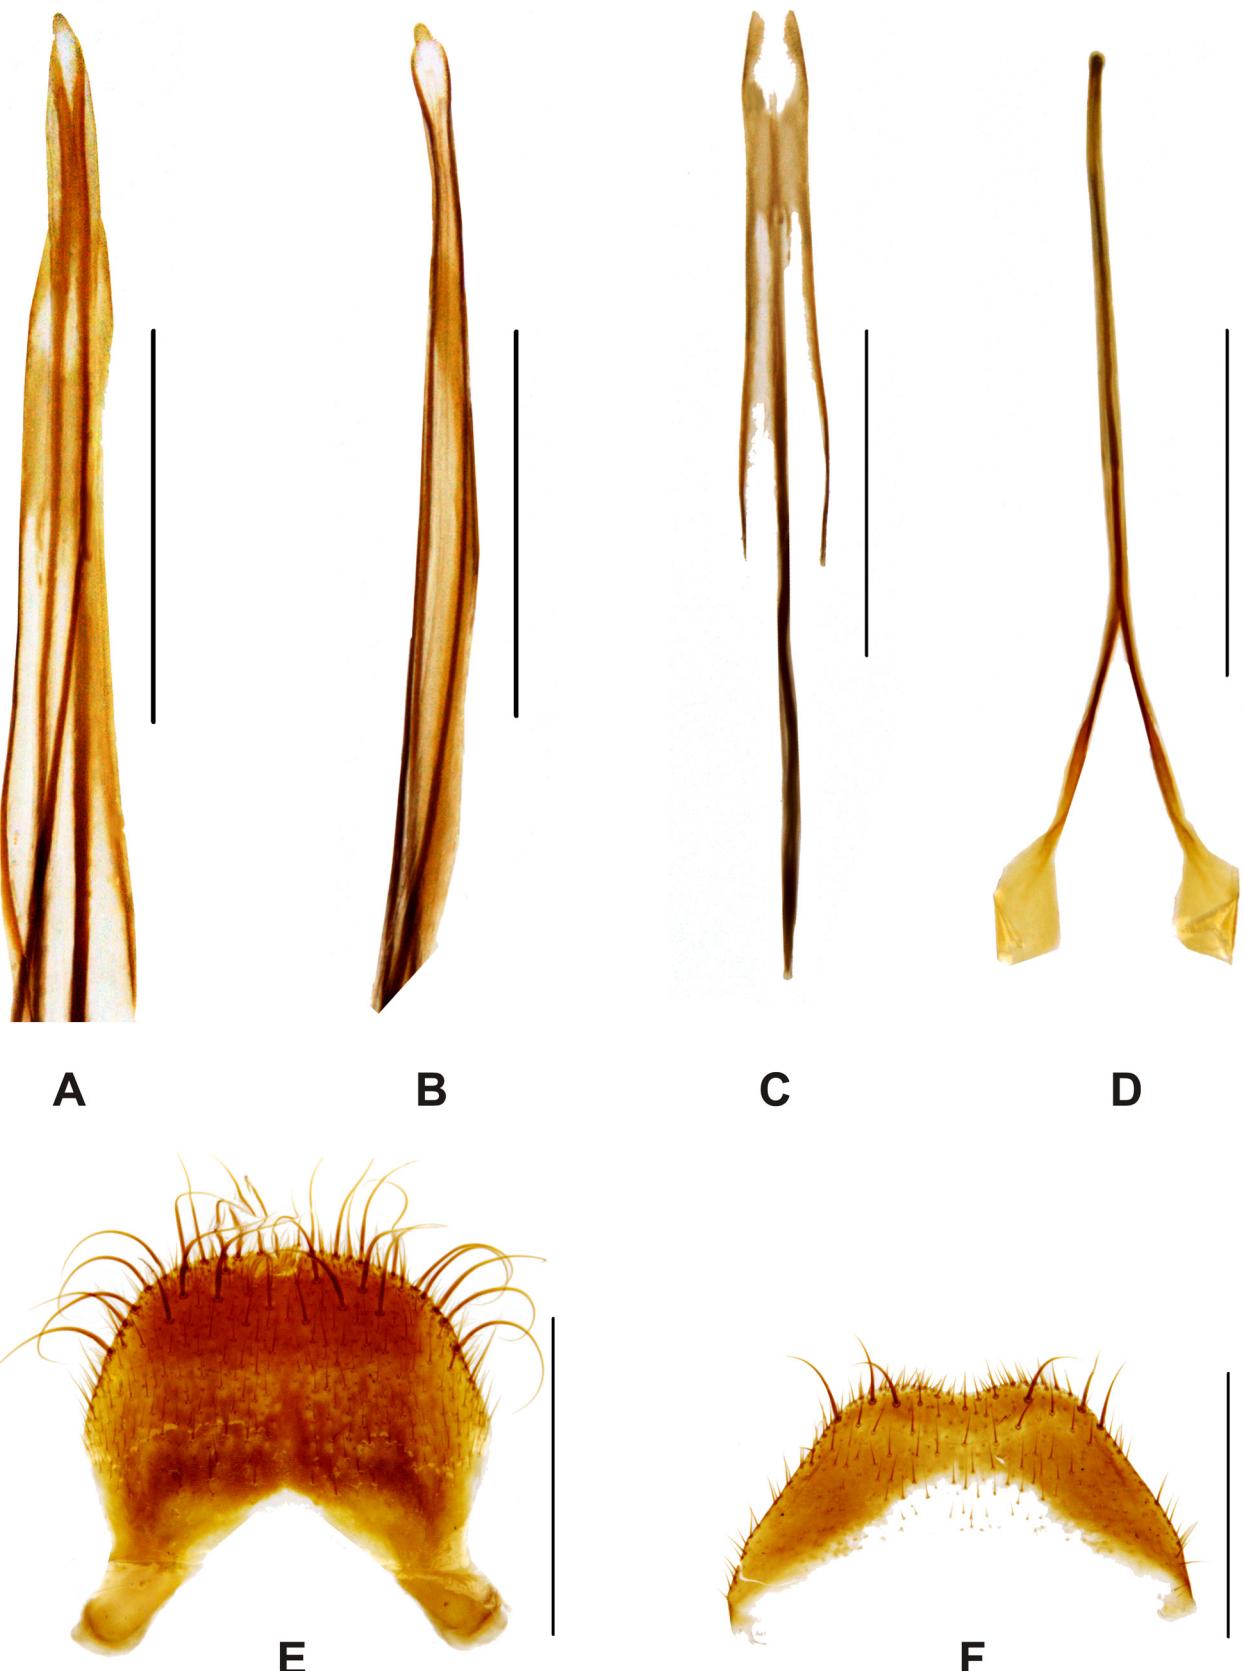

(Figures 25–26, 56B)

*Natalis laevicollis* Blackburn, 1899: 30, 31.

**Specimens examined: Holotype:** 6395, N.Q.T., Australia., Blackburn Coll., B.M. 1910-236., *Natalis laevicollis*, Blackb.; TYPE (BMNH).

**Comment on the type specimen:** Blackburn (1899: 31) mentioned a single specimen in the original description and refers to it as "the type". The specimen labelled 'TYPE' in the Natural History Museum, London (BMNH) is therefore considered the holotype, fixed by original designation (ICZN 1999, Article 73.1.1).

**Diagnosis:** The pronotum of *E. laevicollis* is laterally sinuate and convergent towards the apex; the prothorax is glossy black. The tegmen is characterized by its long lateral processes and two-thirds of the spicular fork is fused.

**Length:** (61 specimens measured) Total length: 15–23 mm.

**Head:** Black, with isolated pilosity; with dense, small punctuation and isolated large punctures; epistomal suture distinct; interocular space about one eye width.

**Thorax:** Pronotal length to width ratio 1.05:1; pronotum glossy black, with isolated pilosity, weak punctuation, sides sinuate, wrinkled; convergent towards apex; grooves of sub-basal collar distinct, separated by a bar. Scutellum dark brown to black, with weak punctuation.

**FIGURE 26.** Distribution of *Eunatalis laevicollis*.

**Elytra:** Elytral length to width ratio 2.32:1; elytra black, partly with a reddish sheen and a broad, reddish transverse fascia; with isolated pilosity; elytral base as wide as pronotum, broader behind the middle; diameter of punctations in basal half as wide as interstices, diameter of punctations in rows 1 to 4 conspicuously decreasing behind middle, diameter of punctures of rows 5 to 8 decreasing just before apex; punctations of tenth stria distinct up to shortly behind middle; punctations of ninth stria vestigial; elytral punctuation with three nodules; interstices 2 only ridged in basal half, interstices 4 ridged shortly behind base, interstices 6 ridged behind middle, interstices with more or less distinct microsculpture.

**Lower surface:** Dark brown to black, with dense pilosity; procoxal cavities slightly opened posteriorly.

**Legs:** Black, with isolated pilosity, with dense punctuation and wrinkles; mesotibiae conspicuously bent.

**Abdomen:** Tegmen closed ventrally, with long processes laterally; spicular fork fused to two-third.

**Distribution:** Coastal region of Queensland, northern part of Northern Territory.

**Seasonal occurrence:** Collected during the whole year.

#### ***Eunatalis laevis* (Waterhouse, 1894)**

(Figures 27–28, 56C)

*Natalis laevis* Waterhouse, 1894: 287; Jordan 1894: t. 13, f. 14.

**Specimens examined: Lectotype** (designated here): Dorey, 94–27; *Natalis laevis* (Type) Waterh. (♀, BMNH).

**Comment on the type specimen:** As Waterhouse (1894) made no reference to specimens in his description it cannot be assumed that the nominal species-group name, *Natalis laevis*, was based on a single specimen. The 'type' specimen located in the Natural History Museum, London (BMNH) must therefore be considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

**Others:** Owgarra, B.N. Guinea Meek (MNHN). Terr. Papua/NG., Okapa Rd., Irafa 7000', 3.VI. 1972; *Eunatalis laevis* (C.O. Waterh.), J.R. Winkler det., 1972 (JKCB). Komba-Bez, D.N. Guinea, L. Wagner leg.; Nolte-Hannover, comp. 24.VIII.1931; Schenkling det., DEI Müncheberg Col-02893 (SDEI). N. Guinea, Hatam: VI, Beccari 1875; *Eunatalis laevis* Waterh.; Teste Schenkling; cfr. schada N. 6492 (MNHN). New Guinea: Tifalmin, IV: 1970, leg. W. Wheatcroft; Collection of Verne Reaves, 2 ex. (FMNH). New Guinea: Tifalmin, XII: 1970, leg. W. Wheatcroft; Collection of Verne Reaves (FMNH). Arfak, Irian Jaya, Indonesia, VII. 2005 (RGCM).

**Diagnosis:** *E. laevis*, the largest clerid species, is distinctly characterized by its size and obsolete elytral punctuation.

**Length:** (9 specimens measured) Total length: 36–53 mm.

**Head:** Black, with isolated pilosity; with dense, small and large punctuation, with weak wrinkles; interocular space about one eye width.

**Thorax:** Pronotal length to width ratio 0.95:1; pronotum dark brown to black, with isolated pilosity and punctuation, conspicuously wrinkled laterally; strongly convergent towards apex; dorsal longitudinal groove very weak to absent; grooves of sub-basal collar less distinct, fused. Scutellum dark brown to black.

**Elytra:** Elytral length to width ratio 2.61:1; elytra light brown to black, with very isolated pilosity; elytra broader behind middle; with hidden punctuation (only very minute punctations between interstices); interstices 2, 4 and 6 weakly ridged; interstices with distinct microsculpture.

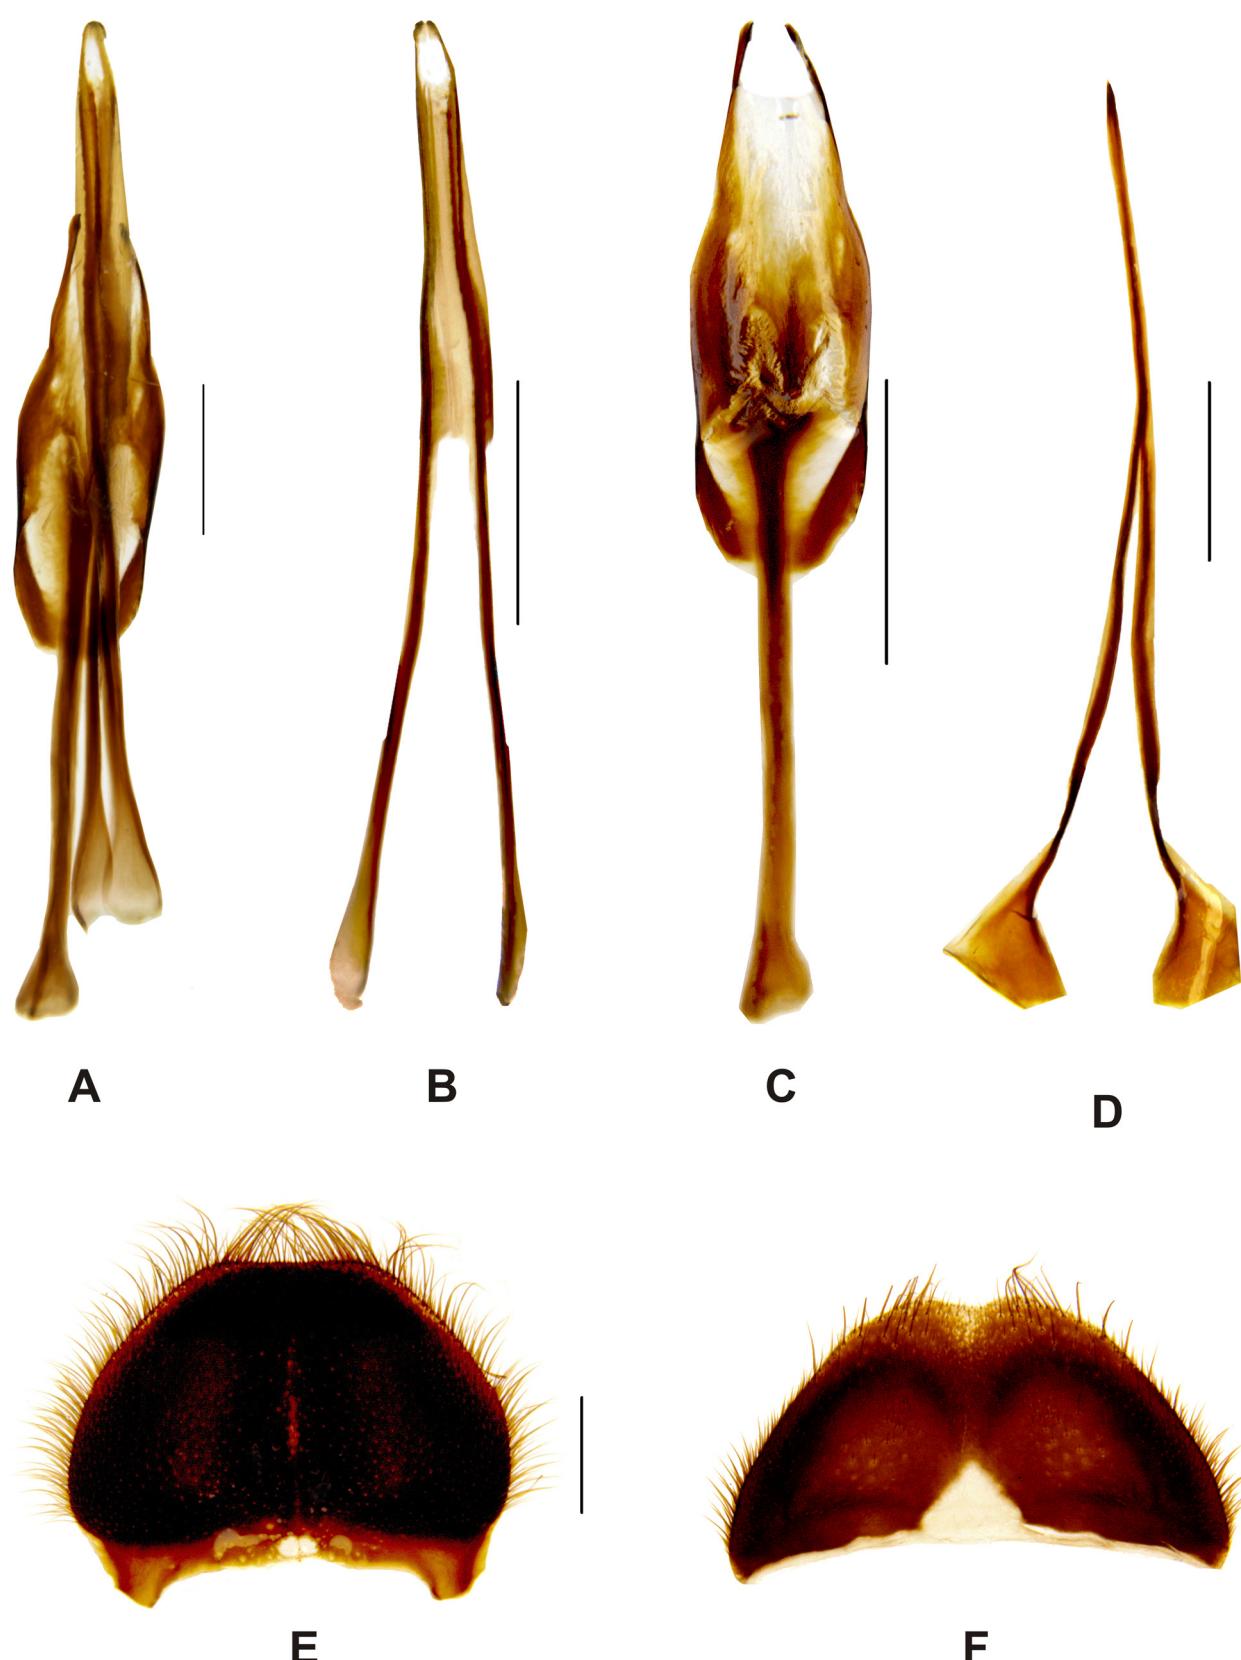

**Lower surface:** Dark brown to black, with dense pilosity; procoxal cavities slightly opened posteriorly.

**Legs:** Black, with dense pilosity mainly at the inner edge of femora, with dense punctuation and wrinkles; mesotibiae conspicuously bent.

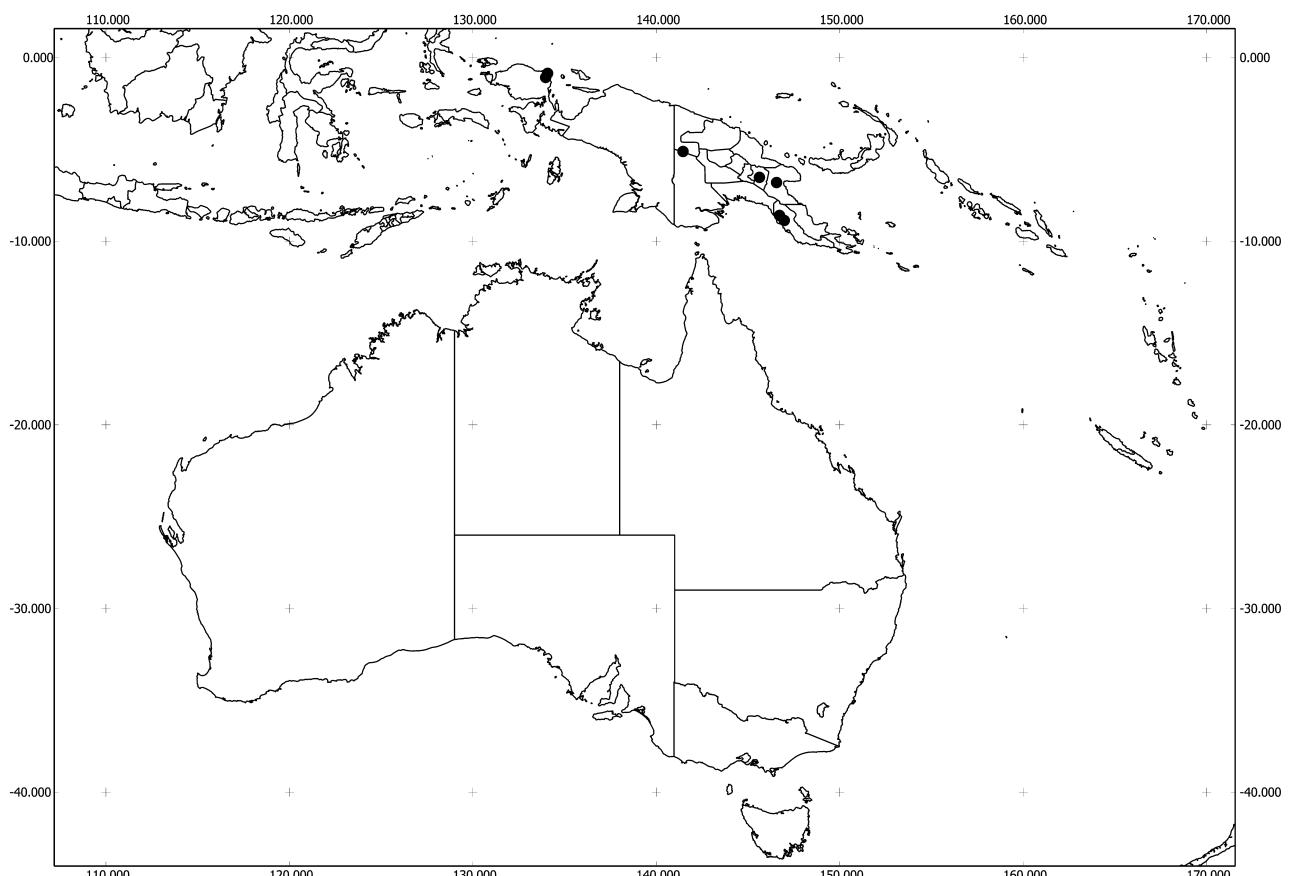

**Abdomen:** Tegmen closed ventrally, constricted conspicuously towards apex; phallic tip open; spicular fork fused halfway.

**Distribution:** New Guinea.

**Seasonal occurrence:** Collected during the whole year.

**FIGURE 27.** *Eunatalis laevis*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrite VI.

**FIGURE 28.** Distribution of *Eunatalis laevis*.

***Eunatalis lugubris* (Blackburn, 1890)**

(Figures 29–30, 56D)

*Natalis lugubris* Blackburn, 1890: 123; Blackburn 1899: 29, 31.

*Eunatalis blackburni* (Waterhouse, 1894): 286; Blackburn 1899: 29 **n. syn.**

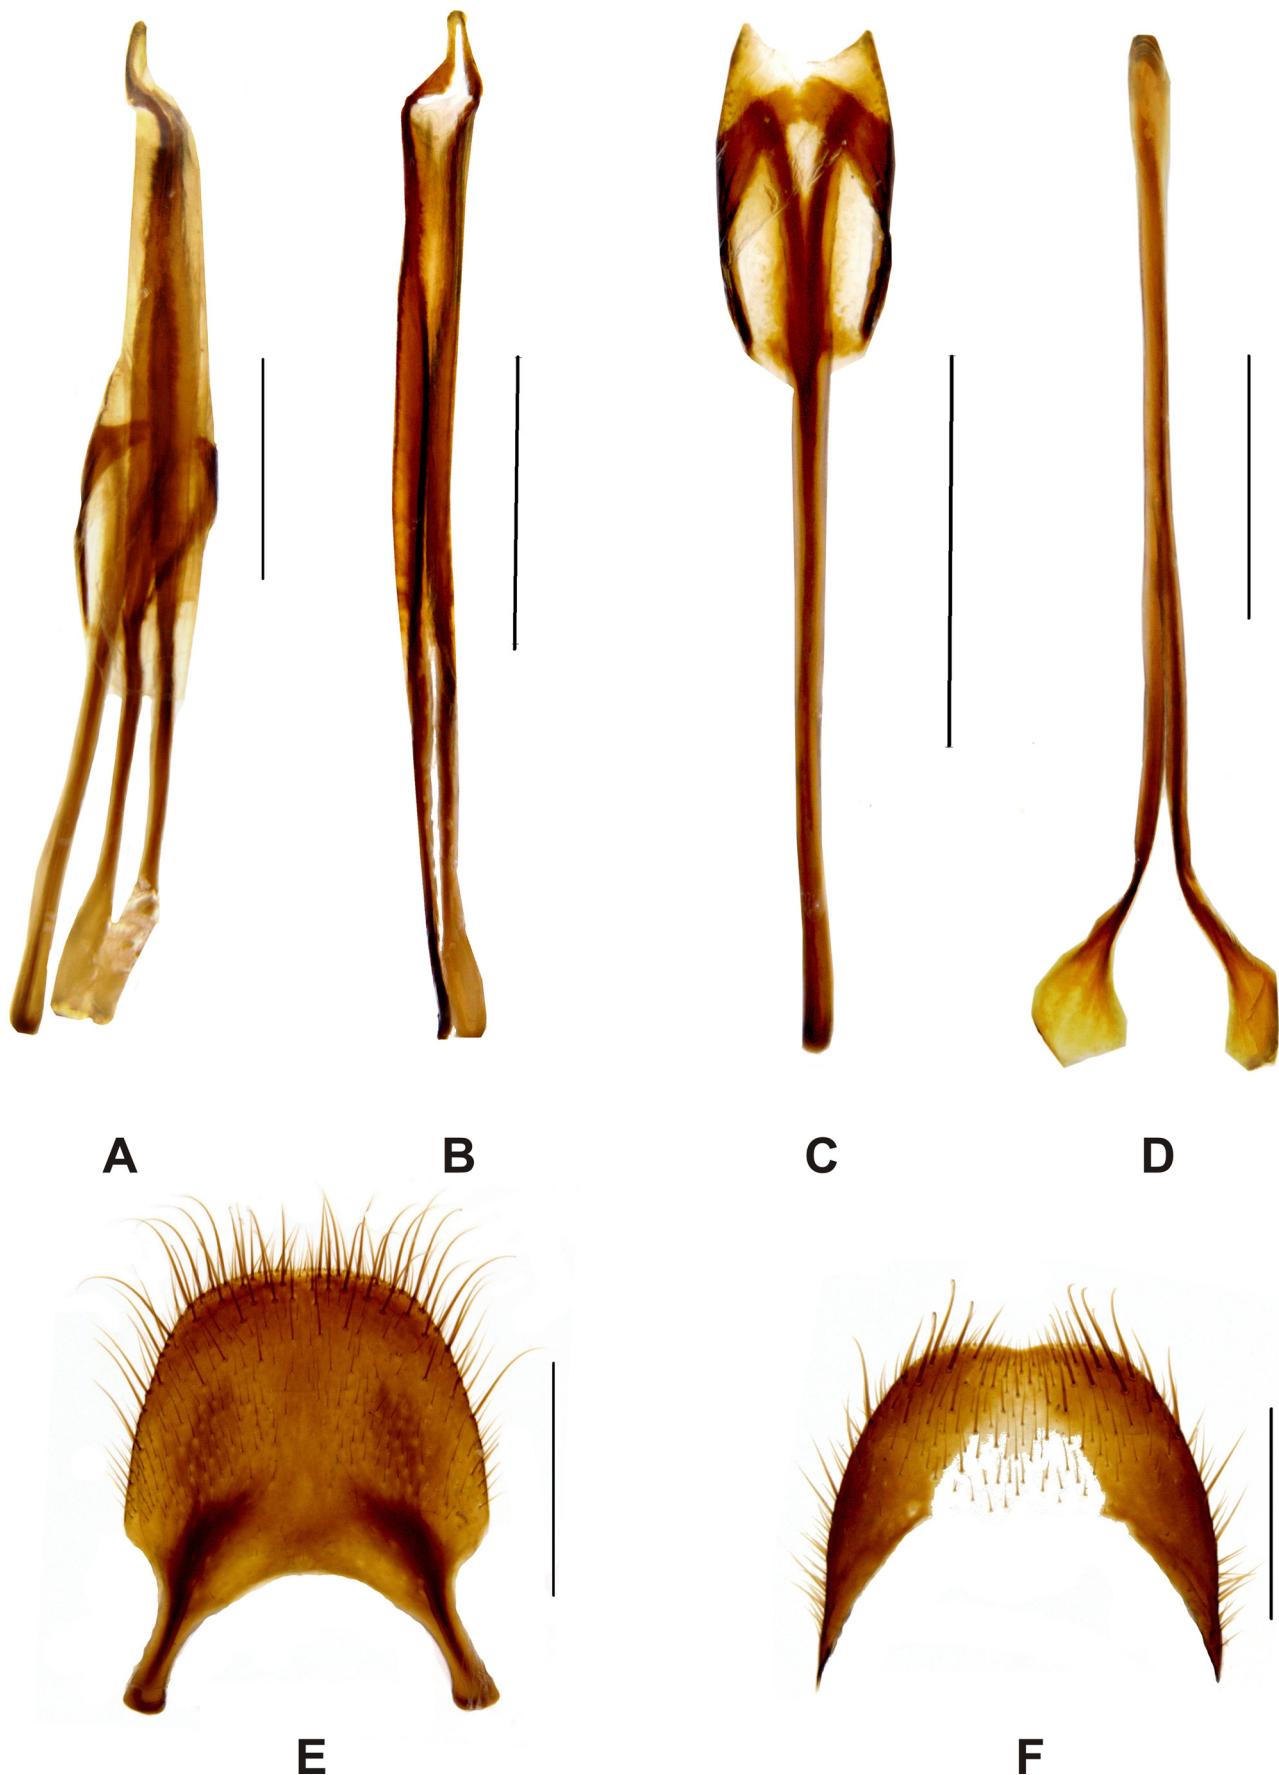

**Specimens examined:** *Natalis lugubris*: Holotype: Type, Australia, Blackburn Coll., B.M. 1910-236; *Natalis lugubris* Blackb. (BMNH).

*Natalis blackburni*: Lectotype (designated here): Swan River, 75.12, *Natalis Blackburni*, (Type) Waterh., (TYPE) (♂, BMNH).

**Comment on the type specimens:** In stating "the example before me" in the original description, Blackburn (1890: 124) implied that the nominal species-group taxon, *Natalis lugubris*, was based on a single specimen. The 'type' located in the Natural History Museum, London (BMNH) is therefore considered the holotype, fixed by monotypy (ICZN 1999: Article 73.1.2). Waterhouse (1894), on the other hand, made no reference to specimens in his description of *Natalis blackburni*, so the 'type' specimen located in the Natural History Museum, London (BMNH) must therefore be considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

Retvo Station, 20 Mi. W. of Capella, Queensland, Austr., Dec. 1936 (JRCP). W Australia, Mc Dermid Rock, 20.x.2001, S. Bily leg.; ex. l. XII.2002, Acacia lasiocalyx (JRCP).

**Diagnosis:** The pronotum of *E. lugubris* is as long as wide, not conspicuously sinuate and only slightly wrinkled laterally; the apex is characterized by an oblique fovea at each side. The tegmen is, in comparison to phallus, very short and the phallic tip is slightly Z-shaped. The spicular fork is fused to four-fifths its length.

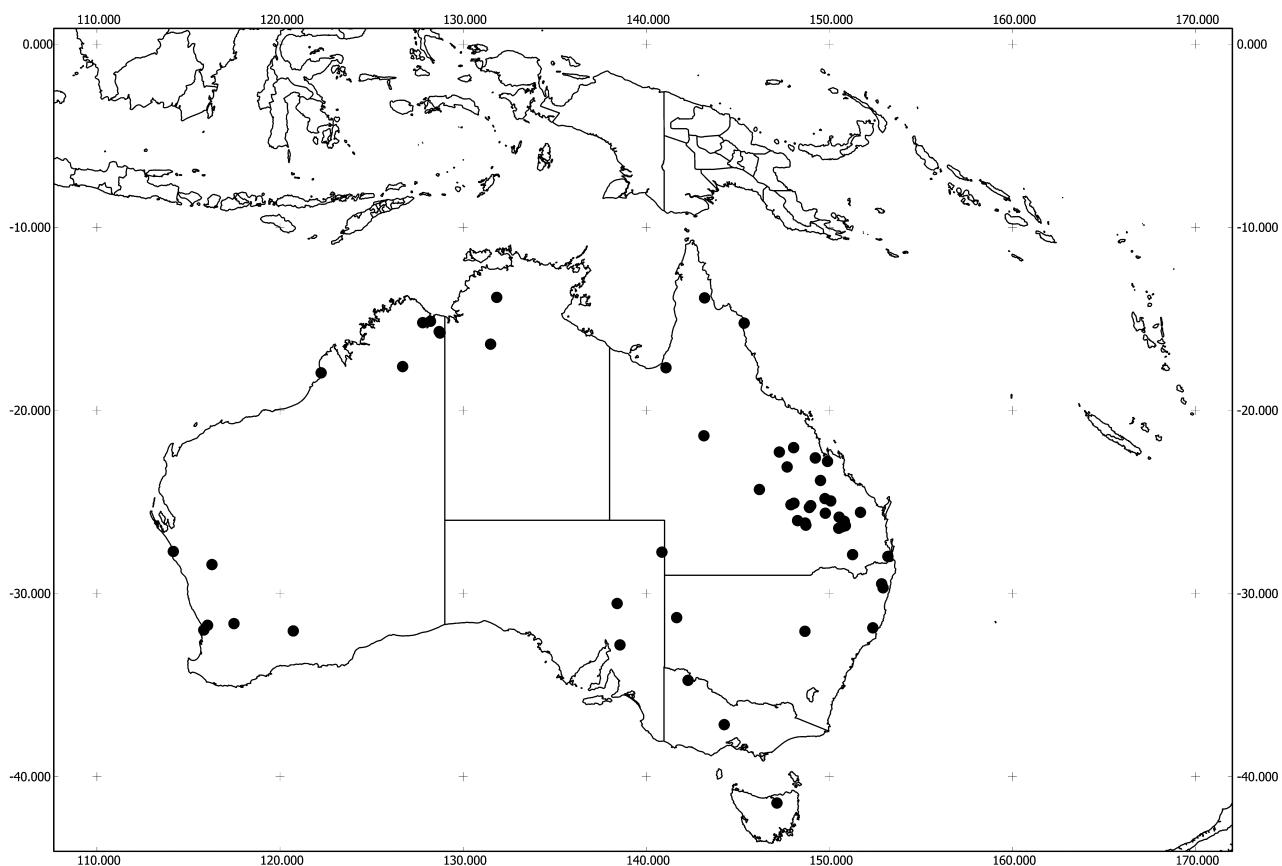

**Length:** (109 specimens measured) Total length: 18–33 mm.

**Head:** Black, with isolated pilosity; with dense, small punctuation and isolated large punctures; epistomal suture distinct; interocular space about one eye width or only slightly more.

**Thorax:** Pronotal length to width ratio 1.0:1; pronotum dark brown to black, with isolated pilosity and punctuation, wrinkled laterally; slightly convergent towards apex; apex with an oblique fovea at each side; grooves of sub-basal collar fused or separated. Scutellum dark brown to black, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.42:1; elytra dark brown to black, with isolated pilosity; base of elytra slightly broader than pronotum, subparallel or broader behind the middle; elytral punctuation oblong in basal half, diameter of punctations as wide as interstices, abruptly decreasing behind the middle, towards apex almost becoming extinct; punctations of tenth stria distinct up to middle; punctations of ninth stria vestigial; elytral punctuation with three nodules; interstices 2 and 4 ridged shortly behind base, interstices 6 and 8 weakly ridged behind the middle, interstices with conspicuous microsculpture.

**Lower surface:** Dark brown to black, with dense pilosity; metaventrite with dense punctuation, weakly wrinkled; abdominal ventrites 2 and 3 with dense, light pilosity in the middle; procoxal cavities slightly opened to closed posteriorly.

**FIGURE 30.** Distribution of *Eunatalis lugubris*.

**Legs:** Black, with dense pilosity and with dense punctuation, with fine wrinkles; mesotibiae conspicuously bent.

**Abdomen:** Tegmen slightly opened ventrally, tegmen in comparison to phallus very short; phallic tip slightly bent Z-shaped, open; spicular fork fused to four-fifth.

**Distribution:** Mainly in Queensland, with further single locations in Western Australia, Northern territory, South Australia, New South Wales and Tasmania.

**Seasonal occurrence:** Collected in November and December.

**Remarks:** *E. lugubris* shows no morphological differences to *E. blackburni* and therefore *E. blackburni* was synonymized with *E. lugubris*. There is a hook-like structure at the ventral sides of the tegmen of *E. blackburni*, but this seems to be in the shape of variation.

### ***Eunatalis mastersii* (MacLeay, 1873)**

(Figures 31–32, 56E)

*Natalis mastersii* MacLeay, 1873: 269.

**Specimens examined: Lectotype** (designated here): *Natalis mastersi* fab., Gaynda, K34049, K 209225; TYPE (♂, AM).

**Comment on the type specimen:** As Macleay (1873: 269) made no reference to specimens in his description it cannot be assumed that the nominal species-group name, *Natalis mastersii*, is based on a single specimen. Despite being labelled 'holotype' (a recent, not original, label) the 'type' located in the Australian Museum, Sydney (AM) must be considered a syntype (ICZN 1999: Article 73.2) and is therefore available for lectotype designation (ICZN 1999: Article 74.1).

**Others:** Belgrave. V., 22.11.19, C. Oke (NVM). *Natalis mastersi* fab., Gaynda, K34049, K 209225; TYPE (AM). Noble Park, V., 30.8.1919, F.E. Wilson, 1881, COL-65737 (NVM). Mallee Dist., V., E.T. Beaumaris (MVM). Parramatta, K-324379 (AM).

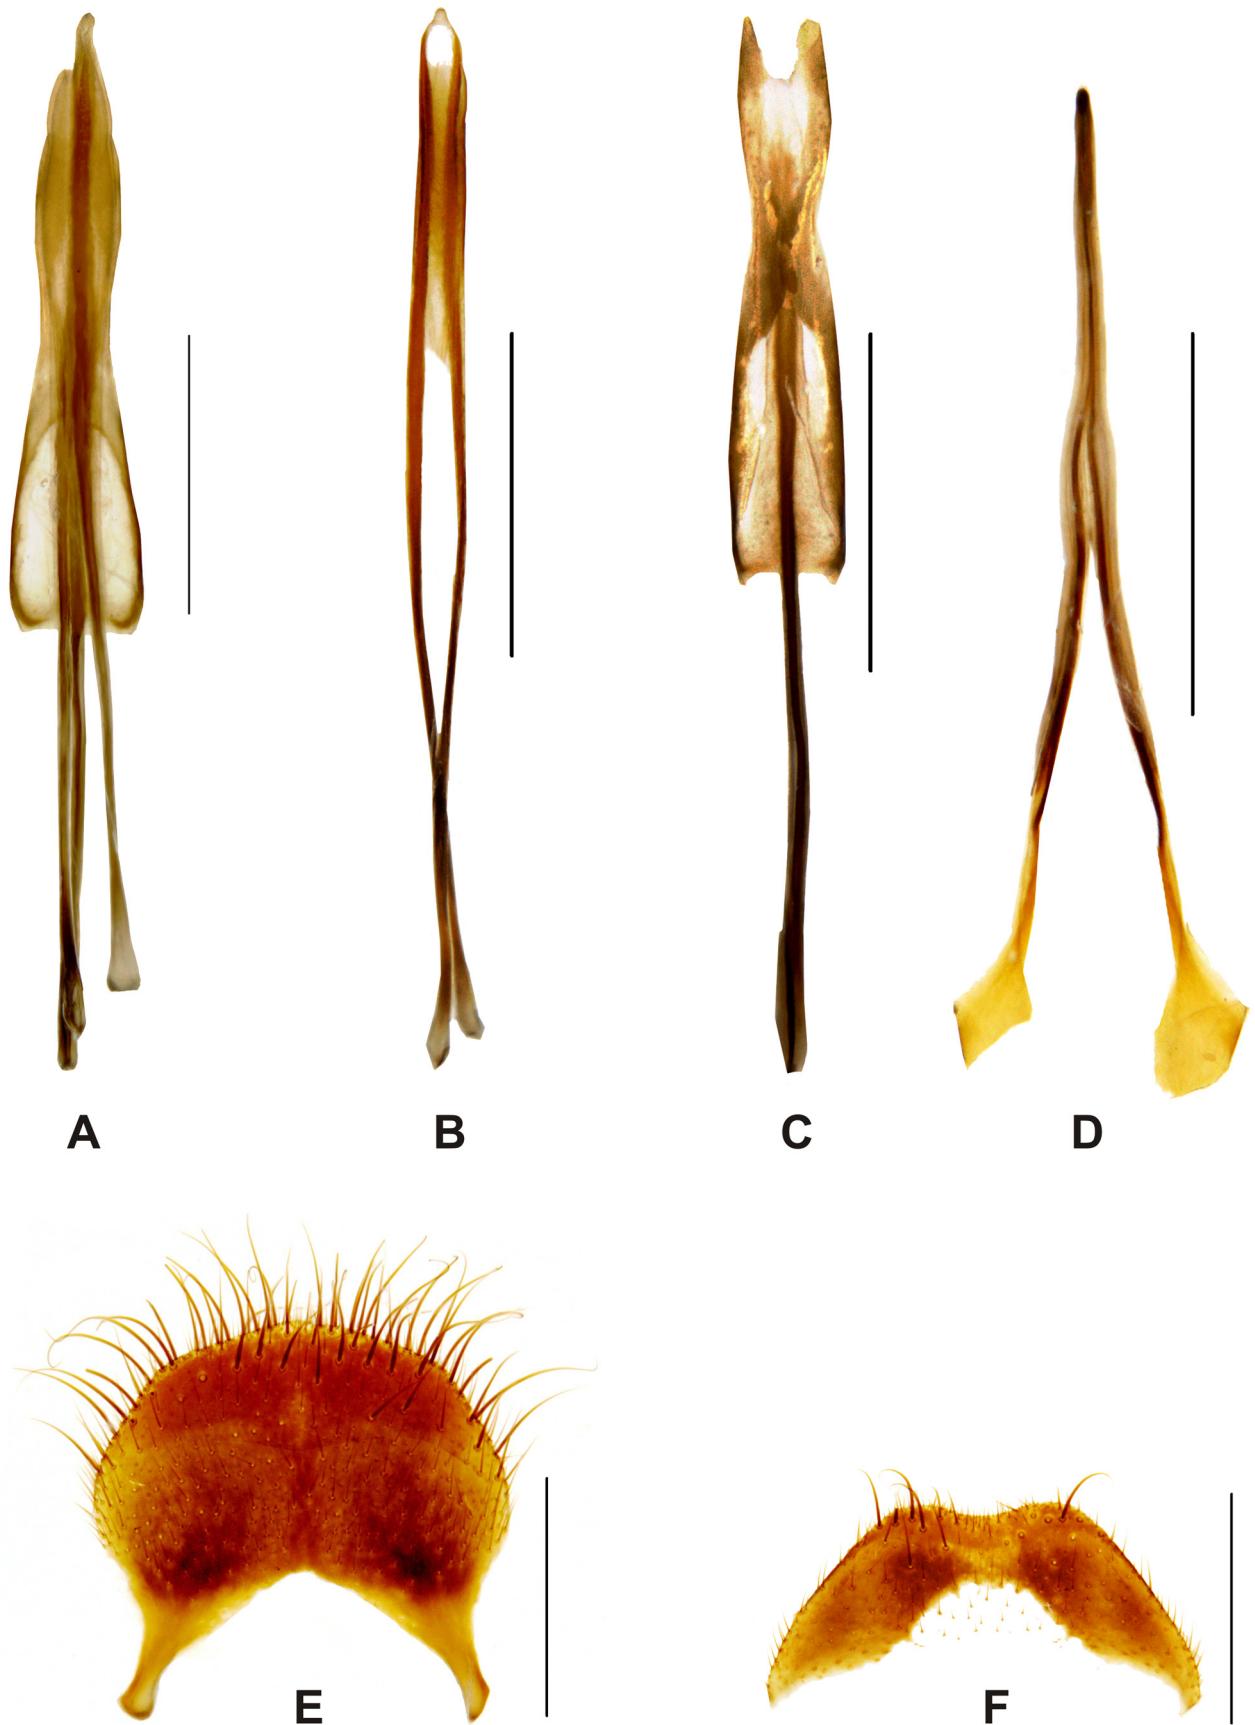

**Diagnosis:** The pronotum of *E. mastersii* is longer than wide, conspicuously sinuate and convergent towards apex. The tegmen is conspicuously narrower in the middle than basally and apically.

**Length:** (49 specimens measured) Total length: 12–23 mm.

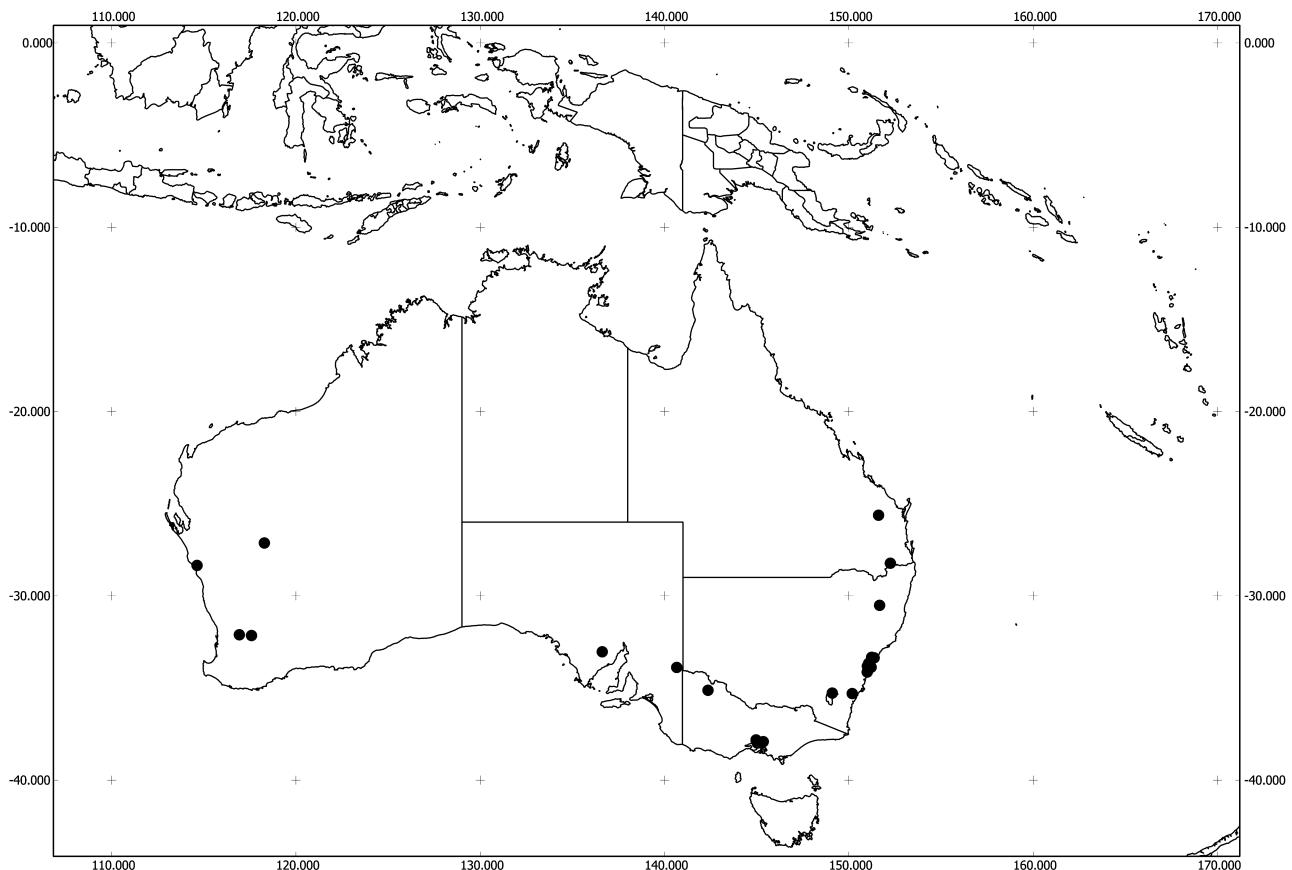

**Head:** Black, with isolated pilosity; with dense punctuation and fine wrinkles; epistomal suture distinct; interocular space about one eye width.

**Thorax:** Pronotal length to width ratio 1.15:1; pronotum dark brown to black, with isolated pilosity and dense punctuation, conspicuously sinuate, wrinkled (but not deeply) laterally; convergent towards apex; longer than broad; grooves of sub-basal collar separated by a wide, distinct bar. Scutellum black, with isolated pilosity and punctuation.

**Elytra:** Elytral length to width ratio 2.58:1; elytra dark brown to black, partly shining reddish in basal half, with isolated pilosity; elytral base less broad than pronotum, slightly wider behind the middle; diameter of punctations slightly broader than interstices, punctations of striae 1 to 4 conspicuously decreasing from the middle,

**FIGURE 31.** *Eunatalis mastersii*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

**FIGURE 32.** Distribution of *Eunatalis mastersii*.

diameter of striae 5 to 8 conspicuously decreasing just before apex; punctations of tenth stria distinct up to shortly behind middle; punctations of ninth stria vestigial; elytral punctuation with three nodules; interstices 6 and 8 weakly ridged from shortly behind the middle; interstices with weak microsculpture.

**Lower surface:** Dark brown to black, with isolated pilosity and punctuation; procoxal cavities closed posteriorly.

**Legs:** Dark brown, with isolated pilosity and fine punctuation; pro- and mesotibiae conspicuously bent.

**Abdomen:** Tegmen in the middle conspicuously narrower than basally and apically; closed ventrally; spicular fork fused up to middle.

**Distribution:** Mainly in the southern parts of Australia.

**Seasonal occurrence:** Collected from August to April.

**Diagnosis:** *E. ninae* n. sp. differs from all other species by the pronotum which is distinctly longer than wide and the head which is characterized by a more or less deep, short, longitudinal groove between the eyes which are strongly convex. The phallic tip is spatulate and bent.

**Length:** (93 specimens measured) Total length: 9–15 mm.

**Head:** Black, with dense, erect yellow pilosity; with dense punctuation and wrinkles; with a more or less deep, short, longitudinal groove between eyes; eyes strongly convex, interocular space about 1.5 to double eye width.

**Thorax:** Pronotal length to width ratio 1.23:1; pronotum dark brown to black, darker around dorsal longitudinal groove; with dense, erect, reddish-yellow pilosity; with more or less dense punctuation, sides conspicuously wrinkled, partly dorsally with transverse wrinkles; grooves of sub-basal collar distinct, separated by a wide bar. Scutellum dark brown, with a fine fringe of hairs, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.72:1; elytra rust-brown or dark brown, with dense, erect, reddish-yellow pilosity; elytral base as wide as pronotum, broader behind middle; diameter of punctations in basal half as wide as interstices, towards apex slightly decreasing; punctations of tenth stria distinct towards apex; punctations of ninth stria vestigial or with slight punctations near apex; elytral punctuation with three nodules; interstices 4 shortly behind base and interstices 6 ridged from the middle.

**Lower surface:** Black, densely covered with white pilosity; procoxal cavities slightly opened to closed posteriorly; posterior part of mesepisternum wrinkled; metaventrite with dense punctuation and fine wrinkles.

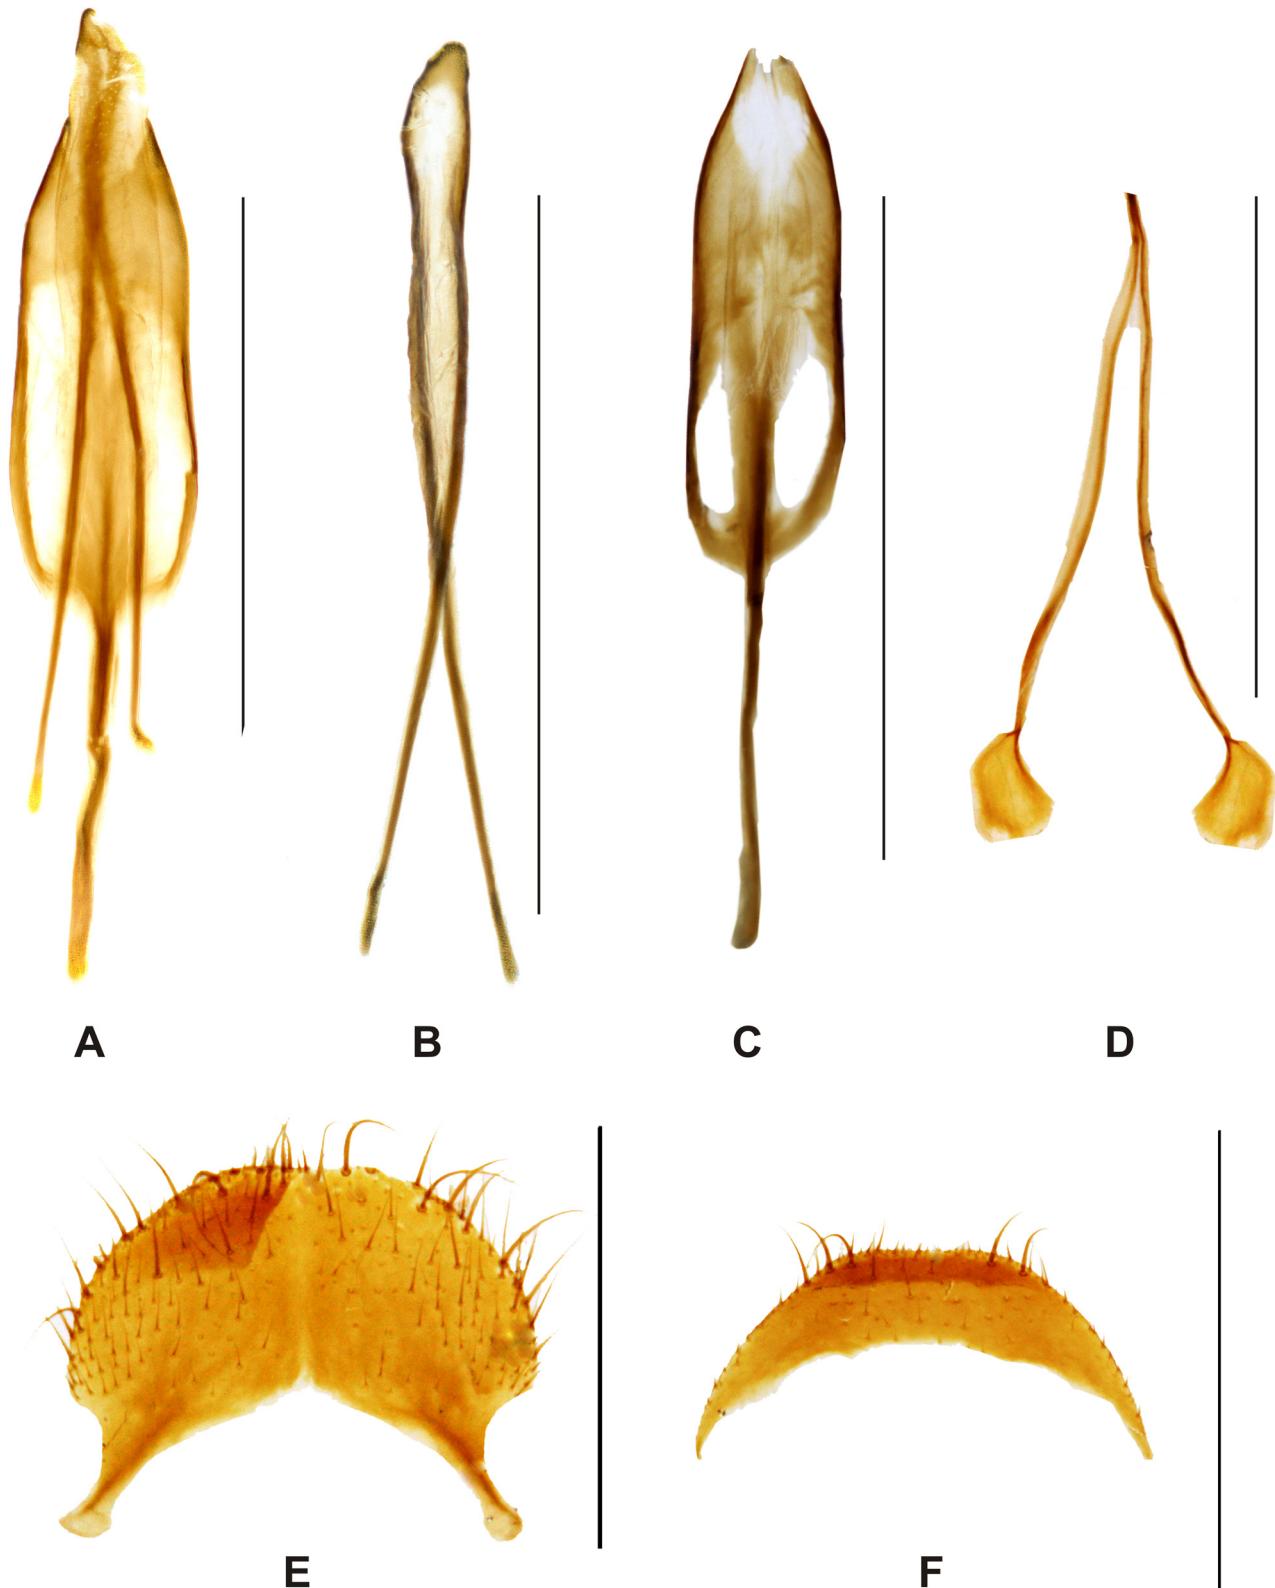

**Legs:** Black, with dense, white pilosity and dense punctuation; finely wrinkled; mesotibiae conspicuously bent.

**Abdomen:** Tegmen ventrally open; phallic tip spatulate and bent; spicular fork fused only at base.

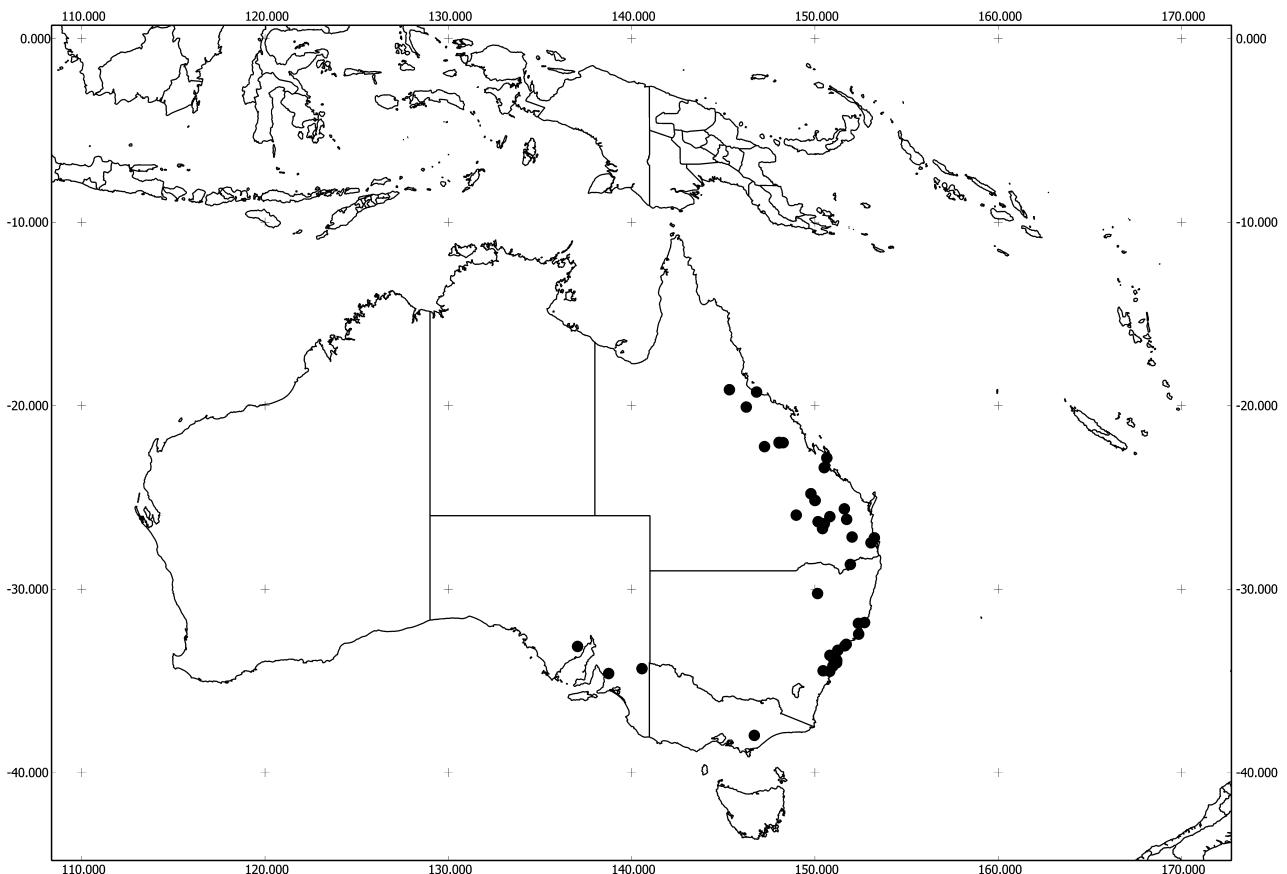

**Distribution:** Mainly at coastal regions in eastern and southern Australia.

**Seasonal occurrence:** Collected from October to June.

**Etymology:** Named after Nina Ableitner, the friend of the junior author.

**FIGURE 33.** *Eunatalis ninae* n. sp.: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventricle VI.

(JRCP). Australia, Victoria, 10.2.1992, Mitcham, G.T. Crake (RGCM). N Queensland, 13.2.2000, Undara, Sv. Bily leg.; 2 ex. (JRCP).

**Diagnosis:** Differs from all other species by the conspicuously emarginate and black nodules of elytral punctuation.

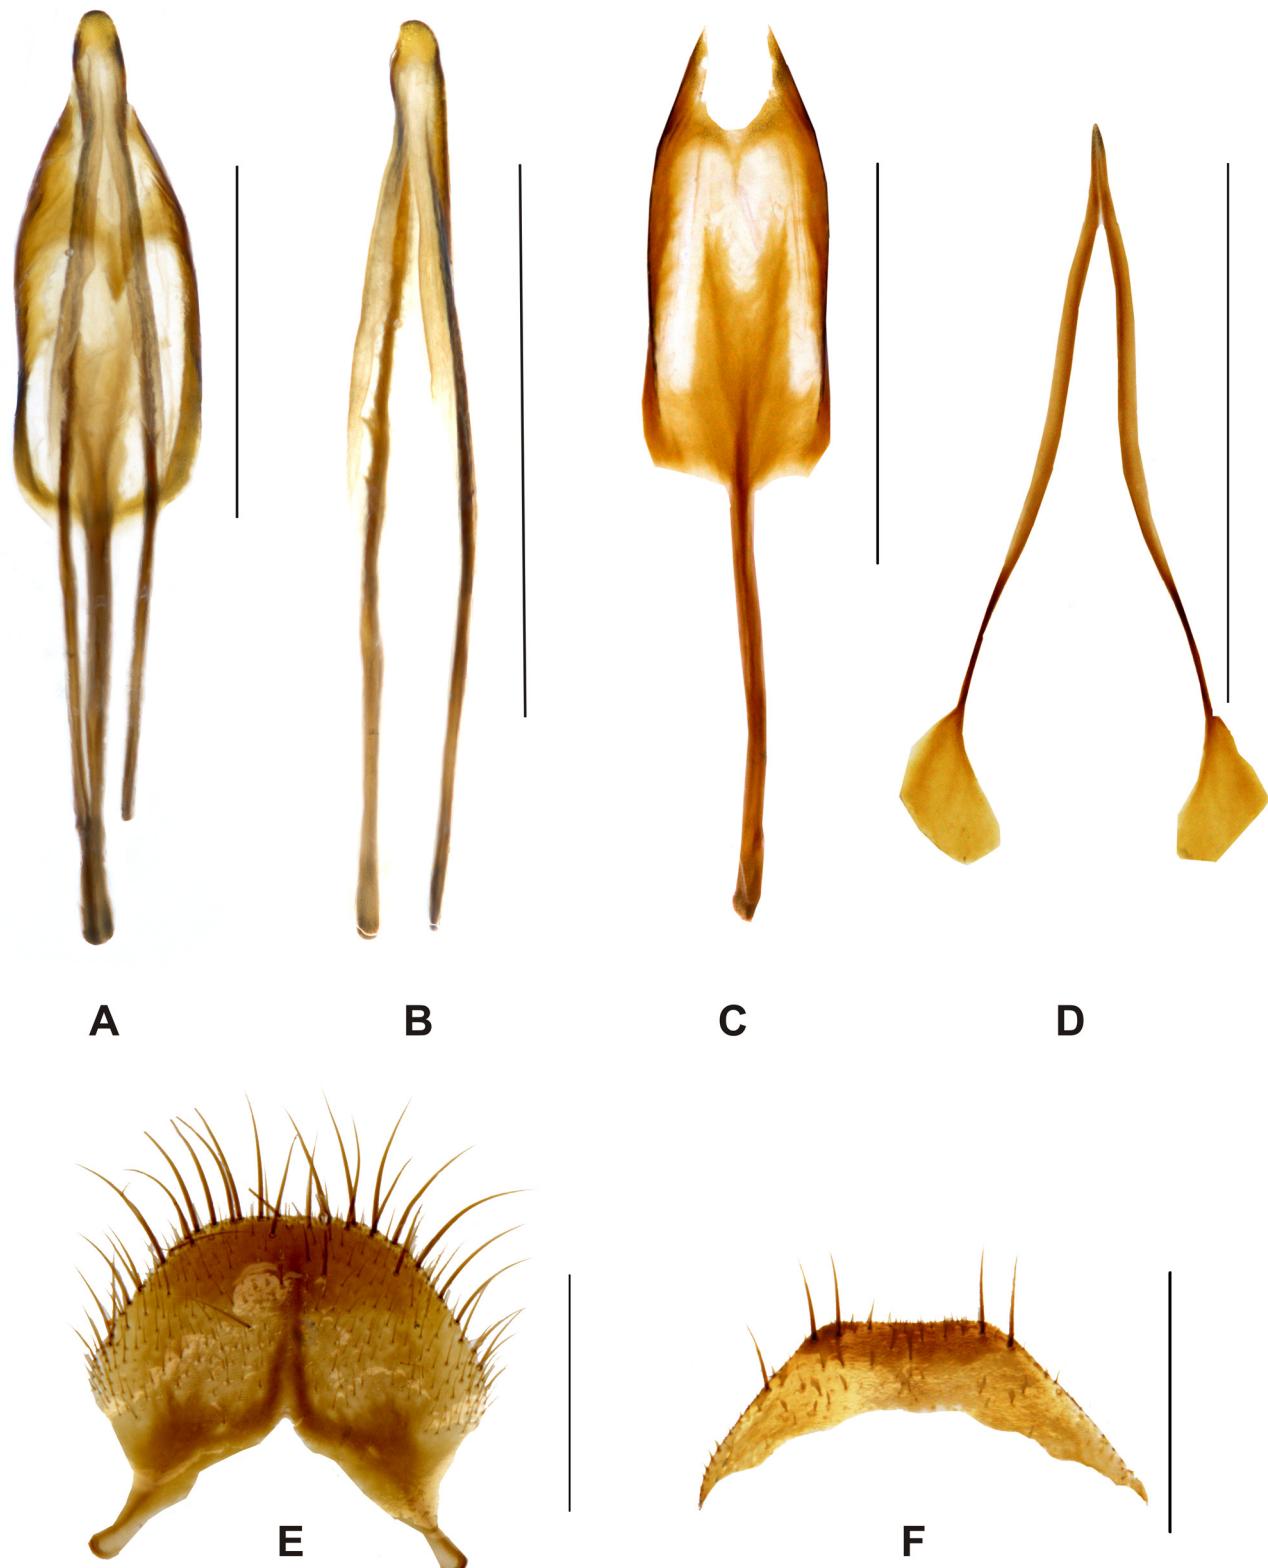

**Length:** (8 specimens measured) Total length: 14–17 mm.

**Head:** Dark brown to black, with dense, fine yellowish pilosity; with dense punctuation and wrinkles; epistomal suture more or less distinct; eyes partially with metallic sheen; interocular space about one to 1.5 eye width.

**Thorax:** Pronotal length to width ratio 1.06:1; pronotum dark brown, with dense, fine yellowish pilosity, with dense punctuation, sides with distinct wrinkles; slightly convergent towards apex; grooves of sub-basal collar distinct, separated by a wide bar or fused. Scutellum dark brown, with isolated pilosity.

**Elytra:** Elytral length to width ratio 2.60:1; elytra light brown to dark brown, basally darker than in apical half,

partially with a light transverse fascia, with isolated, fine, yellowish-white pilosity; elytral base slightly wider than pronotum, broader towards apex; diameter of elytral punctuation in basal half as wide as interstices, slightly decreasing towards apex; punctations of tenth stria distinct almost towards apex; elytral punctuation with three conspicuously emarginate, black nodules; interstices 4 and 6 slightly ridged behind middle, all others flattened; interstices with a conspicuous microsculpture.

**FIGURE 35.** *Eunatalis pernodulosa* n. sp.: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

**Lower surface:** Dark brown to black, with light white pilosity; procoxal cavities slightly opened posteriorly.

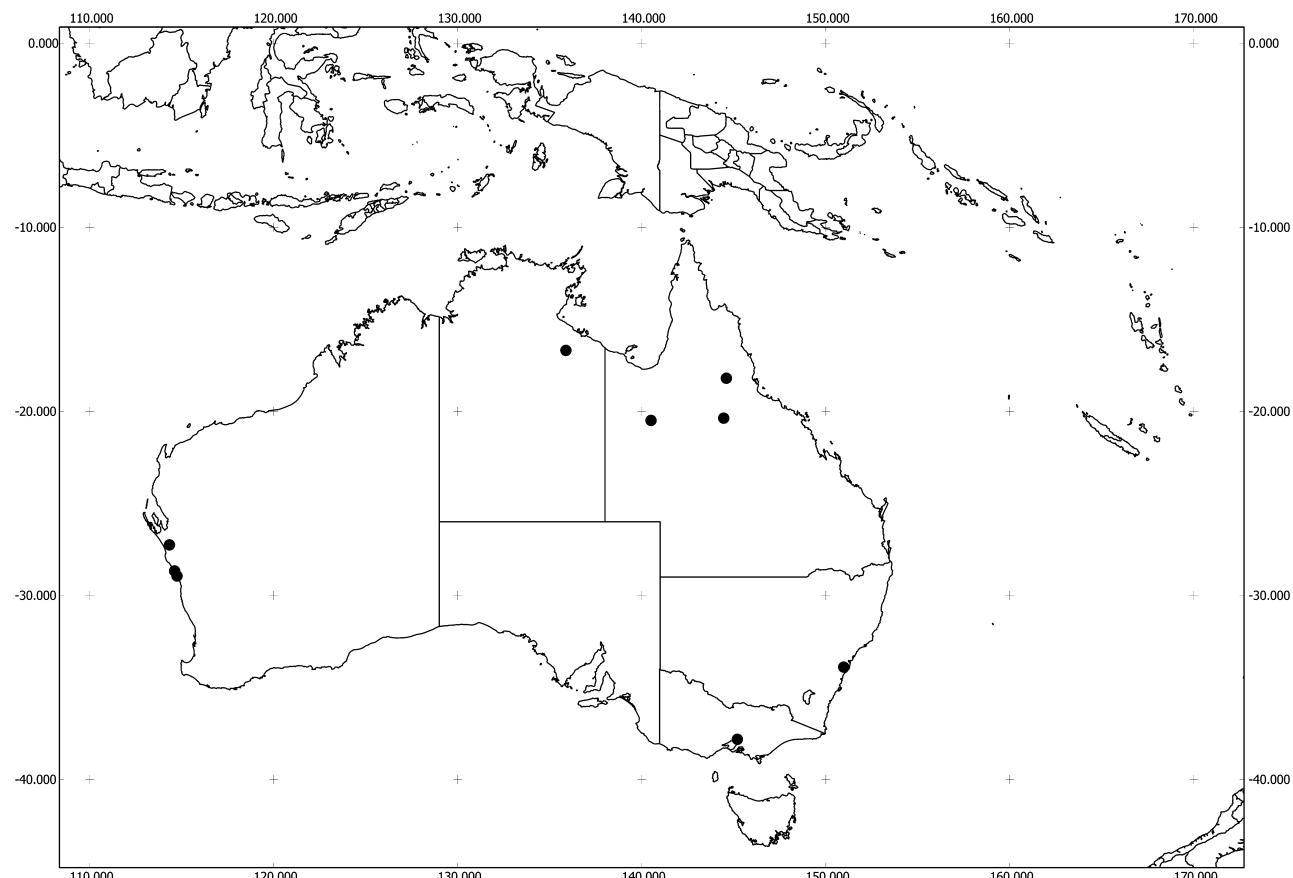

**Legs:** Light brown to dark brown, densely covered with white hairs; finely punctate and wrinkled; mesotibiae bent.

**Abdomen:** Tegmen ventrally closed, sides open; phallic tip spatulate, bent and slightly notched; spicular fork fused only at base.

**Distribution:** Occasional in coastal regions of West Australia and New South Wales, in the interior of Northern Territory and North Queensland.

**Seasonal occurrence:** Collected from August to May.

**Etymology:** The specific epithet, *pernodulosa*, a Latin adjective refers to the conspicuous nodules of the elytral punctations.

**FIGURE 36.** Distribution of *Eunatalis pernodulosa* n. sp.

#### *Eunatalis planipennis* (Blackburn, 1899)

(Figures 37–38, 57B)

*Natalis planipennis* Blackburn, 1899: 30, 32.

*Natalis porcata* Spinola (non Fabricius, 1787) 1844: 201 (t. 16, f. 2); Blackburn 1899: 32.

**Specimens examined:** *Natalis planipennis*: **Lectotype** (designated here): Type; 880 T.; Australia, Blackburn Coll., B.M. 1910-236; *Natalis planipennis*, Blackb. (♂, BMNH). **Paralectotype** (designated here): SAMA Database No. 25-035804; *Natalis planipennis*, Blackb., Cotype; *Natalis planipennis* Bl., aus Tas., 9586 Cotype (SAMA).

**Comment on availability:** *Natalis planipennis*: Although Blackburn (1899: 32) did not provide a description of *N. planipennis* its differentiation from twelve other *Natalis* species within an identification key, and from a closely related species (*N. fasciata*) within comparative notes, is enough to satisfy the terms of ICBN (1999) Article 12.1 regarding it being an available name. Additionally, in stating that *N. planipennis* " = *porcata* Spinola

nec Fab." Blackburn implied an indirect reference to Spinola's (1844: 201) published description (see ICBN 1999: Article 12.2.1) of specimens misidentified as *Natalis porcata* (Fabricius). *Natalis porcata*, sensu Spinola, is not an available name.

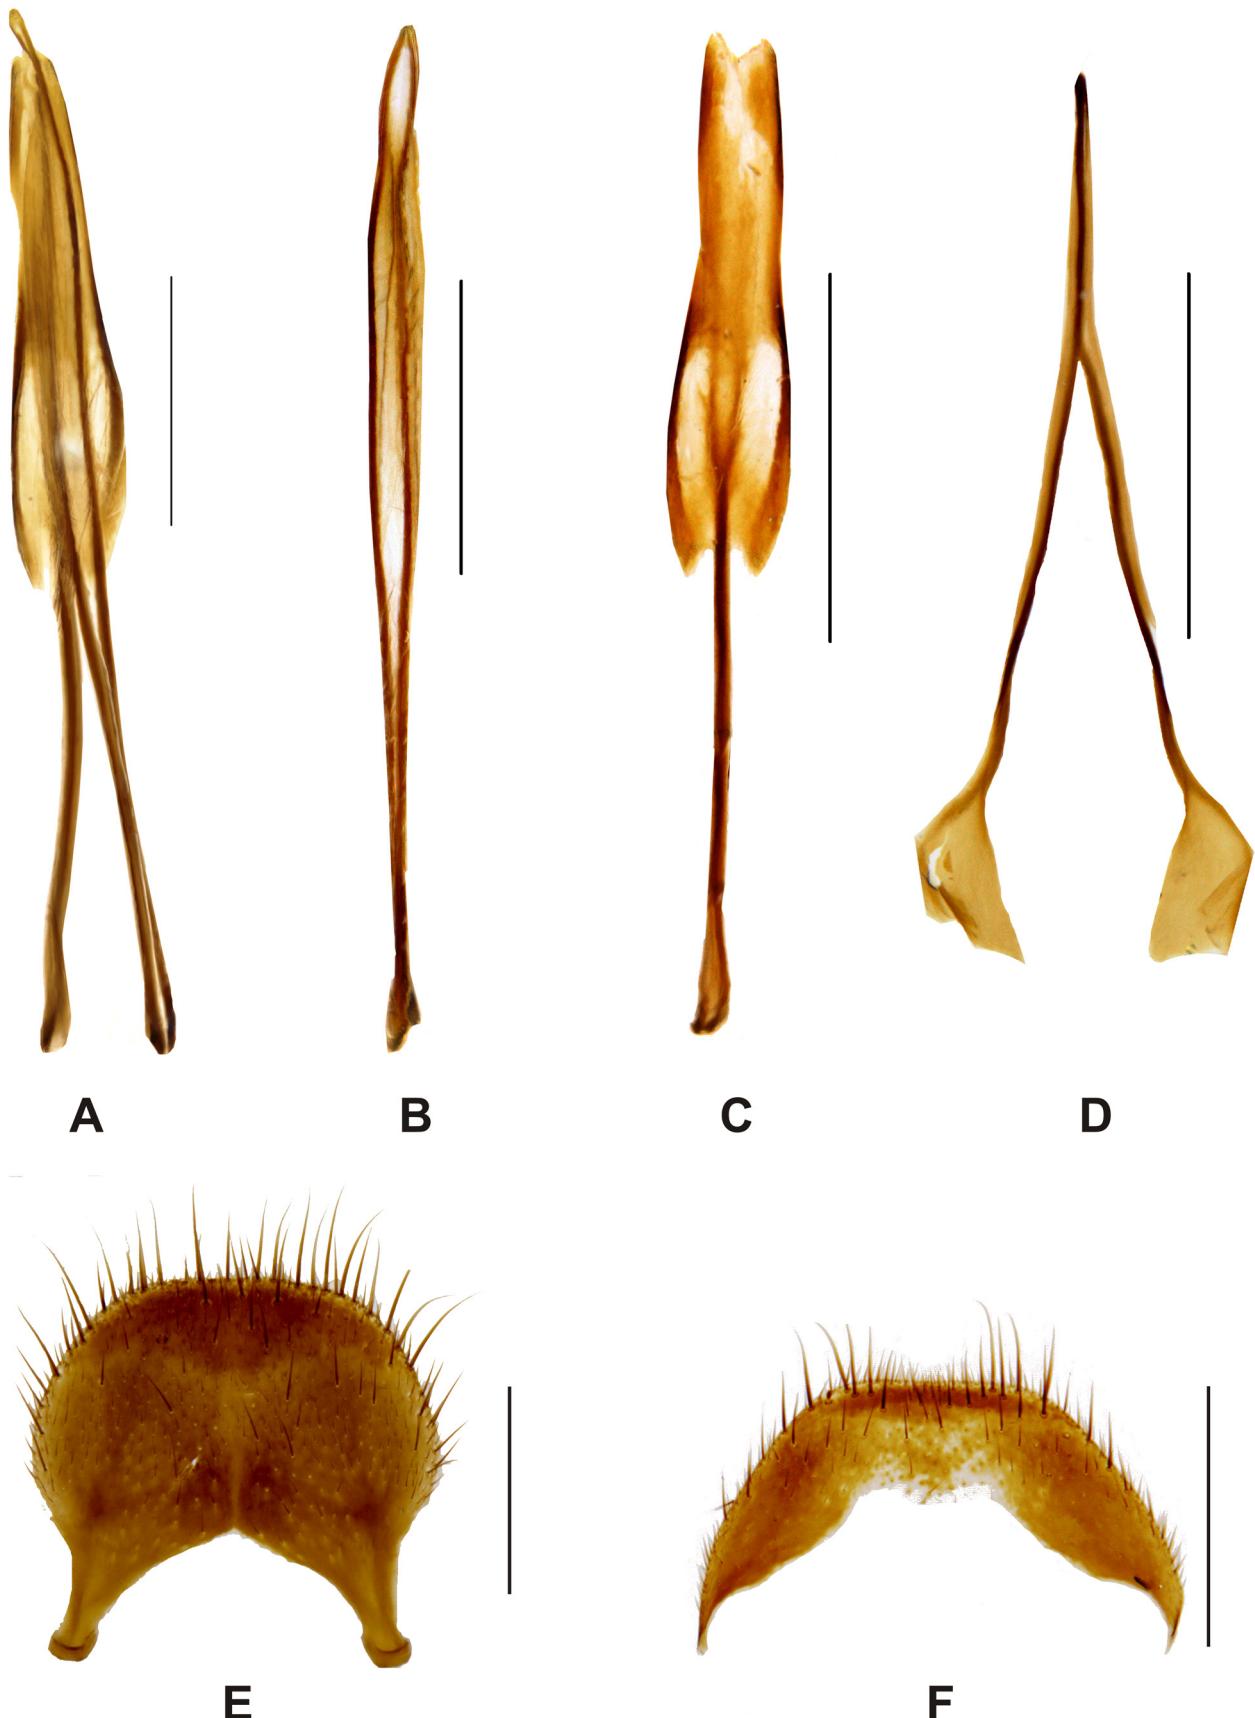

**Comment on the type specimens:** As Blackburn (1899) made no explicit reference to specimens, all *N. planipennis* 'type' material should be treated as syntypes (ICBN 1999: Article 73.2) and, as such, are available for lectotype designation (ICBN 1999: Article 74.1). Following Recommendation 74D (ICBN 1999) we have designated the BMNH syntype the lectotype because the majority of Blackburn's types are held in that institution (Lea 1912). The SAMA syntype is designated a paralectotype.

**Diagnosis:** *E. planipennis* is characterized by the strongly protruding wrinkles at the sides of the pronotum. The habitus is long and slender and the elytra is almost parallel with only interstices 4 and 6 slightly ridged from the middle onwards (all others are flattened). The tegmen is constricted in the middle.

**FIGURE 37.** *Eunatalis planipennis*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrile VI.

**Length:** (827 specimens measured) Total length: 15–26 mm.

**Head:** Black, with isolated greyish pilosity; with dense punctuation and wrinkles; epistomal suture distinct; interocular space from one to 1.5 eye width.

**Thorax:** Pronotal length to width ratio 1.13:1; dark brown to black, with isolated pilosity; slightly convergent towards apex; pronotum with dense small punctuation, sides with strongly protruding wrinkles; grooves of sub-basal collar distinct, fused. Scutellum dark brown to black.

**Elytra:** Elytral length to width ratio 2.80:1; elytra dark brown to black, with isolated pilosity; elytral base slightly broader than pronotum, slightly broader behind middle; elytral punctuation basally as large as interstices, punctations conspicuously decreasing behind middle, and becoming extinct before apex; punctations of striae 7 and 8 only slightly decreasing behind middle, conspicuously decreasing just shortly before apex; punctations of tenth stria distinct towards middle; punctations of ninth stria vestigial; elytral punctuation with three nodules; interstices 4 and 6 slightly ridged from middle onwards, all others flattened; interstices with more or less conspicuous microsculpture.

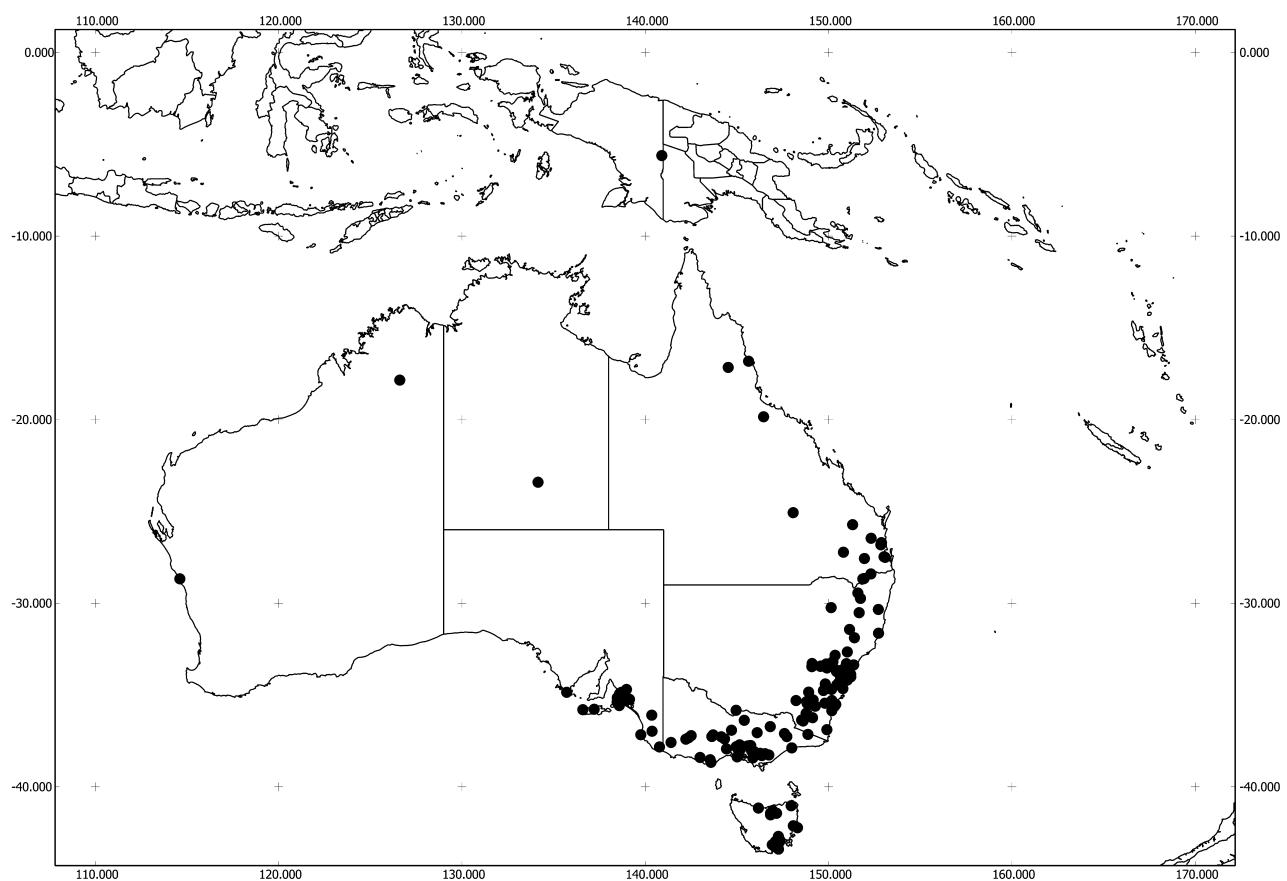

**Lower surface:** Dark brown to black, with dense pilosity; metaventrite densely punctate and finely wrinkled; procoxal cavities slightly opened posteriorly.

**Legs:** Black, with dense pilosity and wrinkles; mesotibiae slightly bent.

**Abdomen:** Tegmen ventrally closed, sides open, in the middle constricted; spicular fork fused to one-third.

**Distribution:** Mainly in coastal regions of South Queensland, Victoria, South Australia and Tasmania, occasionally in the interior and with a single location in New Guinea.

**Seasonal occurrence:** Collected during the whole year.

**FIGURE 38.** Distribution of *Eunatalis planipennis*.

***Eunatalis porcata* (Fabricius, 1787)**

*Natalis inconspicua* Blackburn, 1890: 124; Blackburn 1899: 34.

**Specimens examined:** *Notoxus porcatus*: Lectotype (designated here): Not. Porcatus, F. Mant. Ins. n. (BMNH).

*Natalis cribicollis*: Holotype: Holotype, *Eunatalis cribicollis* (Spinola); MRSN—Torino Coll., Spinola Coleoptera box 419 (MRSN).

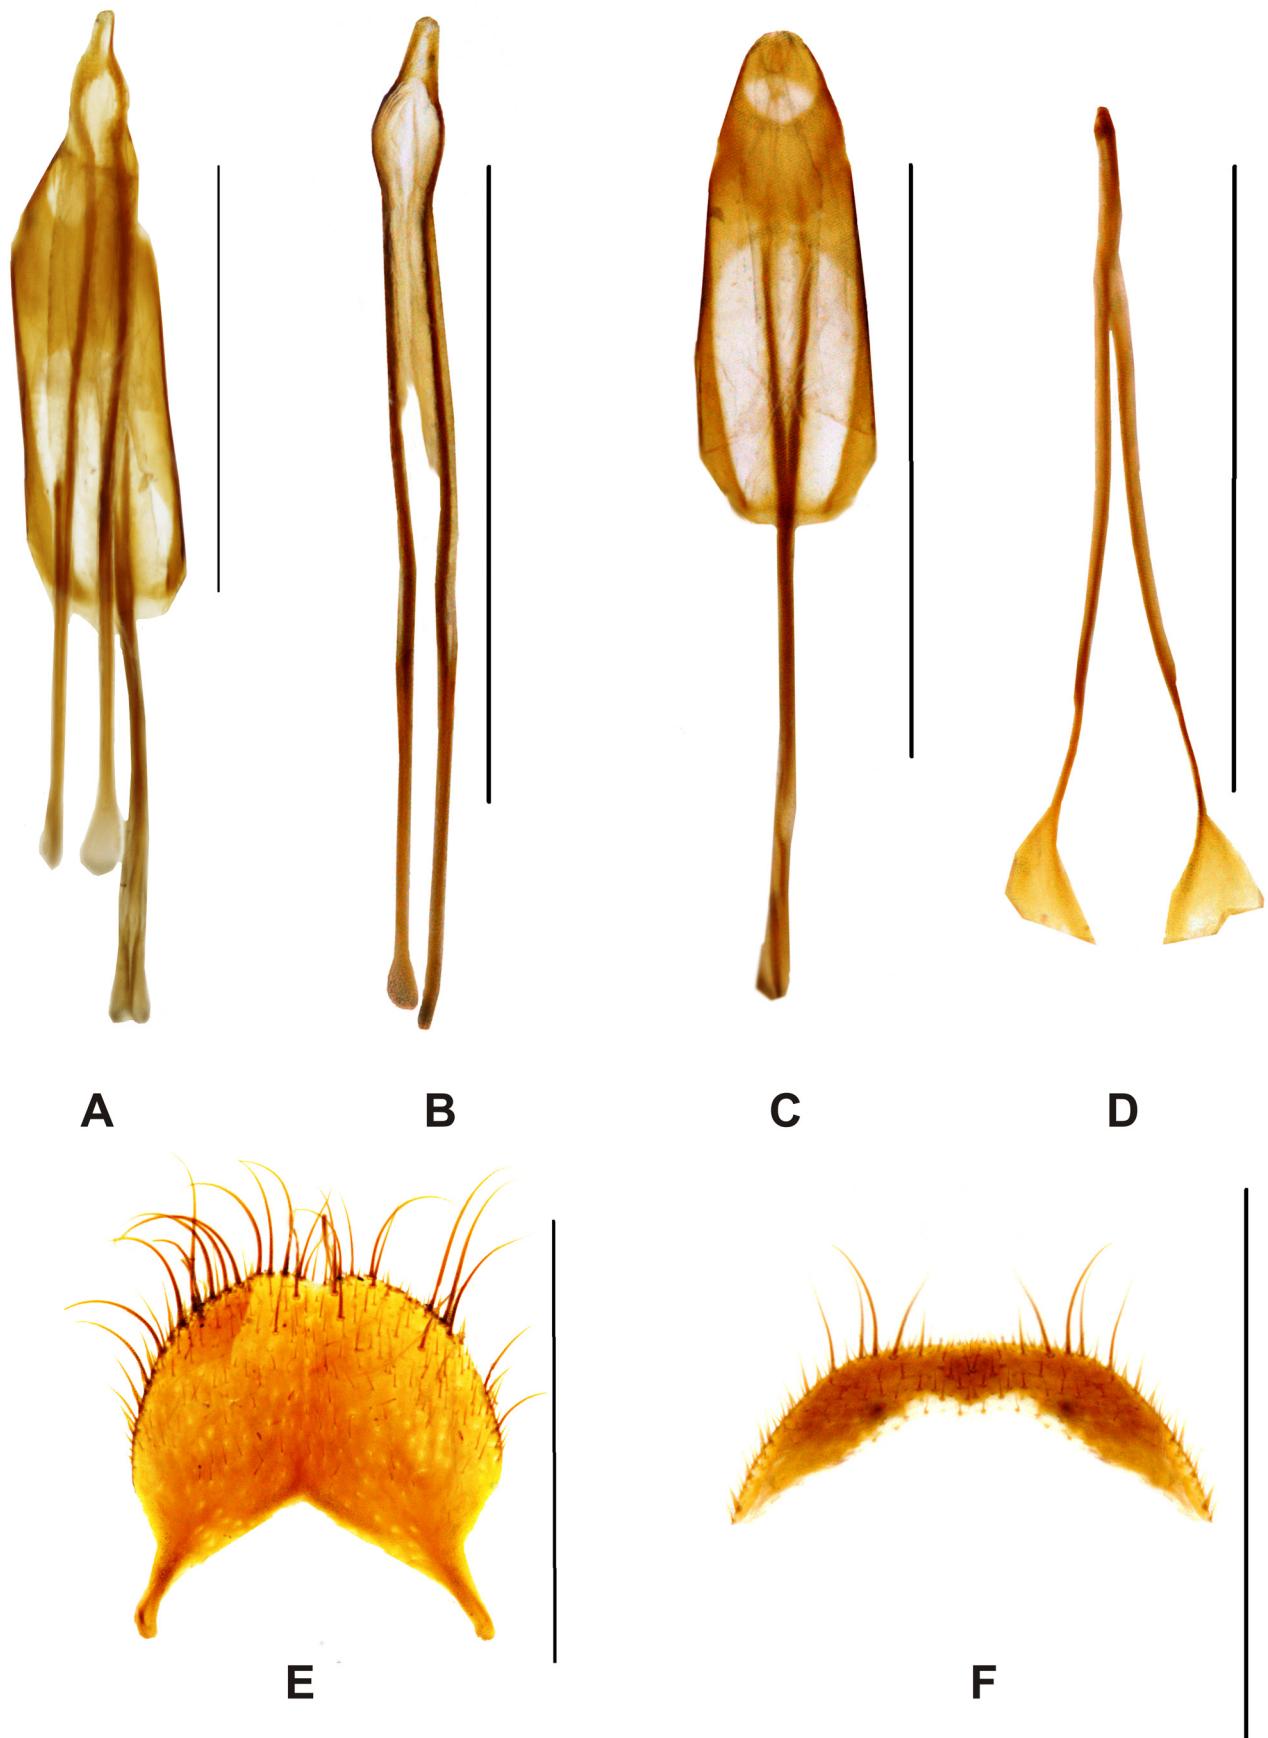

*Natalis inconspicua*: Lectotype (designated here): *Natalis inconspicua*, Blackb.; Australia, Blackburn Coll., B.M. 1910-236; P. 4ine (TYPE) (BMNH).

**Comment on the type specimens:** *Notoxus porcatus*: As Fabricius (1787) made no reference to specimens in his description it cannot be assumed that the nominal species-group name, *Notoxus porcatus*, was based on a single specimen. The 'type' specimen located in the Natural History Museum, London (BMNH) must therefore be considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

*Natalis cribicollis*: At the end of his description Spinola (1844: 203) writes "Une femelle, de la collection Dupont. Mâle, inconnu" (i.e. one female/male unknown), implying that the nominal species-group name, *Natalis cribicollis*, was based on a single specimen. The 'type' specimen lodged at the Museo Regionale di Scienze Naturali, Turino (MRSN) is therefore considered the holotype, fixed by monotypy (ICZN 1999: Article 73.1.2). Ekis (1975), correctly, recognised this specimen as a holotype.

*Natalis inconspicua*: As Blackburn (1890) made no reference to specimens in his description it cannot be assumed that the nominal species-group name, *Natalis inconspicua*, was based on a single specimen. The 'type' specimen located in the Natural History Museum, London (BMNH) must therefore be considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

**Diagnosis:** The long, slender habitus with subparallel elytra is very similar to *E. planipennis*, but *E. porcata* differs from *E. planipennis* by the dense and large pronotal punctation; the pronotal sides are only slightly wrinkled or with coarse punctuation. The tegmen is broad and not constricted in the middle, the phallic tip is round, then constricted

. **Length:** (247 specimens measured) Total length: 11–19 mm.

**Head:** Dark brown to black, with dense pilosity; with dense small and large punctation; epistomal suture more or less distinct; interocular space about 1.5 one eye width.

**FIGURE 40.** Distribution of *Eunatalis porcata*.

**Thorax:** Pronotal length to width ratio 1.15:1; pronotum light brown to dark brown or black; with isolated pilosity; conspicuously longer than wide; with dense, large punctuation; sides slightly wrinkled or with coarse punctuation; grooves of sub-basal collar less distinct, separated by a bar. Scutellum light brown to dark brown, with isolated pilosity.

**Elytra:** Elytral length to width ratio 3.10:1; elytra light to dark brown, with isolated pilosity; elytral base slightly wider than pronotum, subparallel; diameter of punctations in basal half slightly smaller than interstices, punctuation decreasing behind middle; punctations of tenth stria distinct almost towards apex; punctations of ninth stria distinct from middle towards apex; elytral punctuation with three nodules; interstices 4, 5 and 6 slightly ridged in apical half; mostly without microsculpture, partially with very weak microsculpture.

**Lower surface:** Dark brown to black, with dense pilosity; metaventrite and abdominal ventrites with dense punctuation; procoxal cavities opened to closed posteriorly.

**Legs:** Light brown to dark brown, with dense pilosity and punctuation, with fine wrinkles; mesotibiae bent.

**Abdomen:** Tegmen ventrally closed, sides open; phallic tip round, then constricted; spicular fork fused to one-fourth.

**Distribution:** Tasmania and mainly in coastal regions of southern Australia, with a single location in Western Australia.

**Seasonal occurrence:** Collected during the whole year.

***Eunatalis punctata* Gerstmeier & Seitner 2013, n. sp.**

(Figures 41–42, 57D)

**Specimens examined: Holotype:** 50mls., N.E. of Mullewa, W.A., May. 1958, A. Snell (NMV).

**Paratypes:** Australia: WA, Comet Vale, 130k N of Kalgoorlie, A. Sundholm/J. Bugeja, to MV light (ANIC). Austl: W. Austl., 13km NE Giles, Glen Gerald, 16-V-1983, FMHD#83-661, L.E. Watruss (FMNH). 25km E Wahroonga, HS, 25°29'22"S 114°38'41"E, WA, 15–16 July 2007, T.F. Houston 1217-5 & E.G. Cunningham; TFH1217-5, gas lantern/pitfall trap on dune crest, 6 pm–9.30 am (WAMP). 73 miles N. of Northampton, WA., 22 April 1968, I.F.B. Common & M.S. Upton (ANIC). Australia, N.S.W., Euabelong, WEST, 1.1998, leg. Anderson (CMLN). Station Ck., N.Q., Mulligan H'way, 9m S. of Mt. Carbine, 28.11.70, m.v.l., R. Hardy (ANIC). Station Ck., N.Q., 1/70, GB. (RGCM). N Queensland, 5.2.2000, Ravenshoe, Sv. Bily leg. (JRCP).

**Diagnosis:** Pronotum with dense, large and small punctuation, which is similar to *E. debilis* (though *E. debilis* is much more slender with extended pronotum and elytra). Pygidium compact, with very short and broad processes, ventrite VI deeply emarginate; phallobase dilated.

**Length:** (9 specimens measured) Total length: 15–17 mm.

**Head:** Black, with isolated pilosity; with dense large and small punctuation; epistomal suture not distinct; interocular space about one to 1.5 one eye width.

**Thorax:** Pronotal length to width ratio 1.07:1; pronotum black, with isolated pilosity; conspicuously sinuate, slightly convergent towards apex; with dense, large and small punctuation, sides wrinkled; grooves of sub-basal collar distinct, separated by a wide, distinct bar. Scutellum dark brown to black, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.54:1; elytra dark brown to black, with isolated pilosity; elytral base slightly broader than pronotum, elytra subparallel to slightly broader behind middle; elytral punctuation at base conspicuously broader than interstices, punctations decreasing towards apex; punctations of tenth stria distinct almost towards apex; punctations of ninth stria vestigial (in one specimen with isolated small punctuation); elytral punctuation with three nodules; interstices flattened and almost not ridged, microsculpture weak or absent.

**Lower surface:** Dark brown to black, with isolated pilosity, especially metaventrite with dense punctuation and fine wrinkles; procoxal cavities slightly opened posteriorly.

**Legs:** Black, with isolated pilosity, with dense punctuation and fine wrinkles; mesotibiae bent.

**Abdomen:** Tegmen ventrally closed, sides open; phallobase dilated; spicular fork fused to halfway.

**Distribution:** Mainly Western Australia, one locality in New South Wales.

**Seasonal occurrence:** Collected from November to July.

**Etymology:** The specific epithet, *punctata*, a Latin adjective refers to the dense punctuation of pronotum.

**FIGURE 42.** Distribution of *Eunatalis punctata* n. sp.

***Eunatalis schopfi* Gerstmeier 2013, n. sp.**

(Figures 43–44, 57E)

**Specimens examined: Holotype:** Armidale, N.S.W., 16 Dec. 1960, J. Frazier, at light (ANIC).

**Paratypes:** Austral., Victoria, CNHM 1955, Karl Brancsik Colln., ex Eduard Knirsch (FMNH). Adelaide, Blackburn; 25-035799 (SAMA). 36.37S 141.39E, 31km S NHill, VIC, 26 Oct. 1983, D. Rentz, M. Harvey, Stop41 (ANIC). Yarrowyck, Bundarra Road, 5 Aug. 1962, C.W. Frazier (ANIC). Black Mt, ACT, light trap 24.XII.65, I.F.B. Common (RGCM). Blackheath (NMV). BATH K324370 (AM). Austral, Natalis fasciata Blackb., S. Schenkling det. (BMNH).

**Diagnosis:** *E. schopfi* n. sp. is clearly recognizable by the extended pronotum and elytra. The metatibiae are conspicuously extended and there are fine wrinkles around the elongated pronotal groove. The phallic tip is notched, with a spoon-like structure; the spicular fork is only fused for less than one-sixths of its length.

**Length:** (9 specimens measured) Total length: 17–21 mm.

**Head:** Black, with isolated pilosity; with very dense punctuation, fine wrinkles; epistomal suture very distinct; interocular space about one to 1.5 one eye width.

**Thorax:** Pronotal length to width ratio 1.15:1; pronotum black, with isolated hairs, dense punctuation and fine wrinkles; sides sinuate, slightly convergent towards apex, conspicuously longer than broad; grooves of sub-basal collar not very distinct, separated by a bar. Scutellum black, with dense punctuation.

**Elytra:** Elytral length to width ratio 3.02:1; elytra black, in the middle with a reddish or yellow transverse fascia; with isolated pilosity; elytral base slightly wider than pronotum, slightly broader behind the middle; elytra three times as long as wide; diameter of punctations in basal half wider than interstices, towards apex smaller, diameter of punctations in striae 1 to 4 conspicuously smaller, diameter of punctations in striae 5 to 8 slightly smaller than interstices, punctations of tenth stria distinct almost towards apex; punctations of ninth stria vestigial;

elytral punctation with three nodules; interstices 2, 4, 6 and 8 slightly ridged from middle, interstices with distinct microsculpture.

**Lower surface:** Black, with isolated pilosity; especially metaventre with very dense punctuation and fine wrinkles; procoxal cavities closed posteriorly.

**FIGURE 43.** *Eunatalis schopfii* n. sp.: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrite VI.

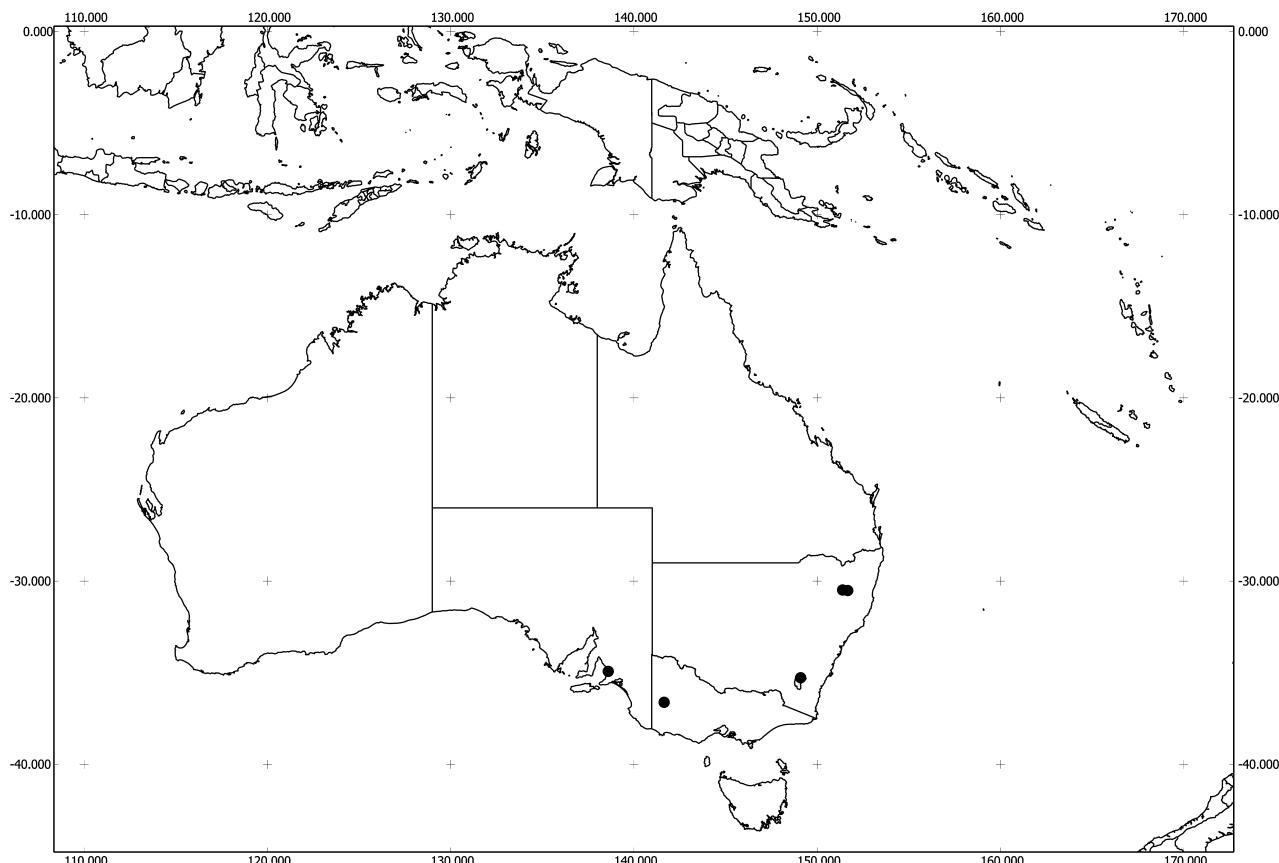

**Legs:** Black, with dense pilosity, with very dense punctuation and fine wrinkles; mesotibiae slightly bent, metatibiae conspicuously extended.

**Abdomen:** Tegmen ventrally open; phallic tip with a notched, spoon-like structure; spicular fork fused for less than one-sixth.

**Distribution:** New South Wales and Victoria.

**Seasonal occurrence:** Collected in August, October and December.

**Etymology:** Named after Prof. Dr. Reinhard Schopf, a colleague of the senior author at the Department of Animal Ecology.

**FIGURE 44.** Distribution of *Eunatalis schopfi* n. sp.

***Eunatalis semicostata* (Blackburn, 1889)**

(Figures 45–46, 57F)

*Natalis semicostata* Blackburn, 1889: 1427; Blackburn 1899: 29, 31.

*Euatalis alternicostata* (Kuwert, 1893): 484; Blackburn 1899: 29, **n. syn.**

*Eunatalis lata* (Waterhouse, 1894): 287; Blackburn 1899: 29, **n. syn.**

**Specimens examined:** *Natalis semicostata*: Lectotype (designated here): *Natalis semicostata*, Blackb., Australia., Blackburn Coll., B.M. 1910-236., 2421 T.; Type (BMNH).

*Natalis alternicostata*: Lectotype (designated here): *Natalis alternicostatus* Kuw., New Holland, ? TYPE; (TYPE *Alternicostatus*) (MNHM).

*Natalis lata*: Lectotype (designated here): Moreton Bay; *Natalis latus*, (Type) Waterh. (Type) (BMNH).

**Comment on the type specimens:** *Natalis semicostata*: In stating "the examples before me", Blackburn (1889: 1428) indicated that the nominal species-group taxon, *Natalis debilis*, was based on more than one specimen. As there is nothing in his paper indicating which specimen Blackburn considered the 'type', the specimen

located in the Natural History Museum, London (BMNH) is therefore considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

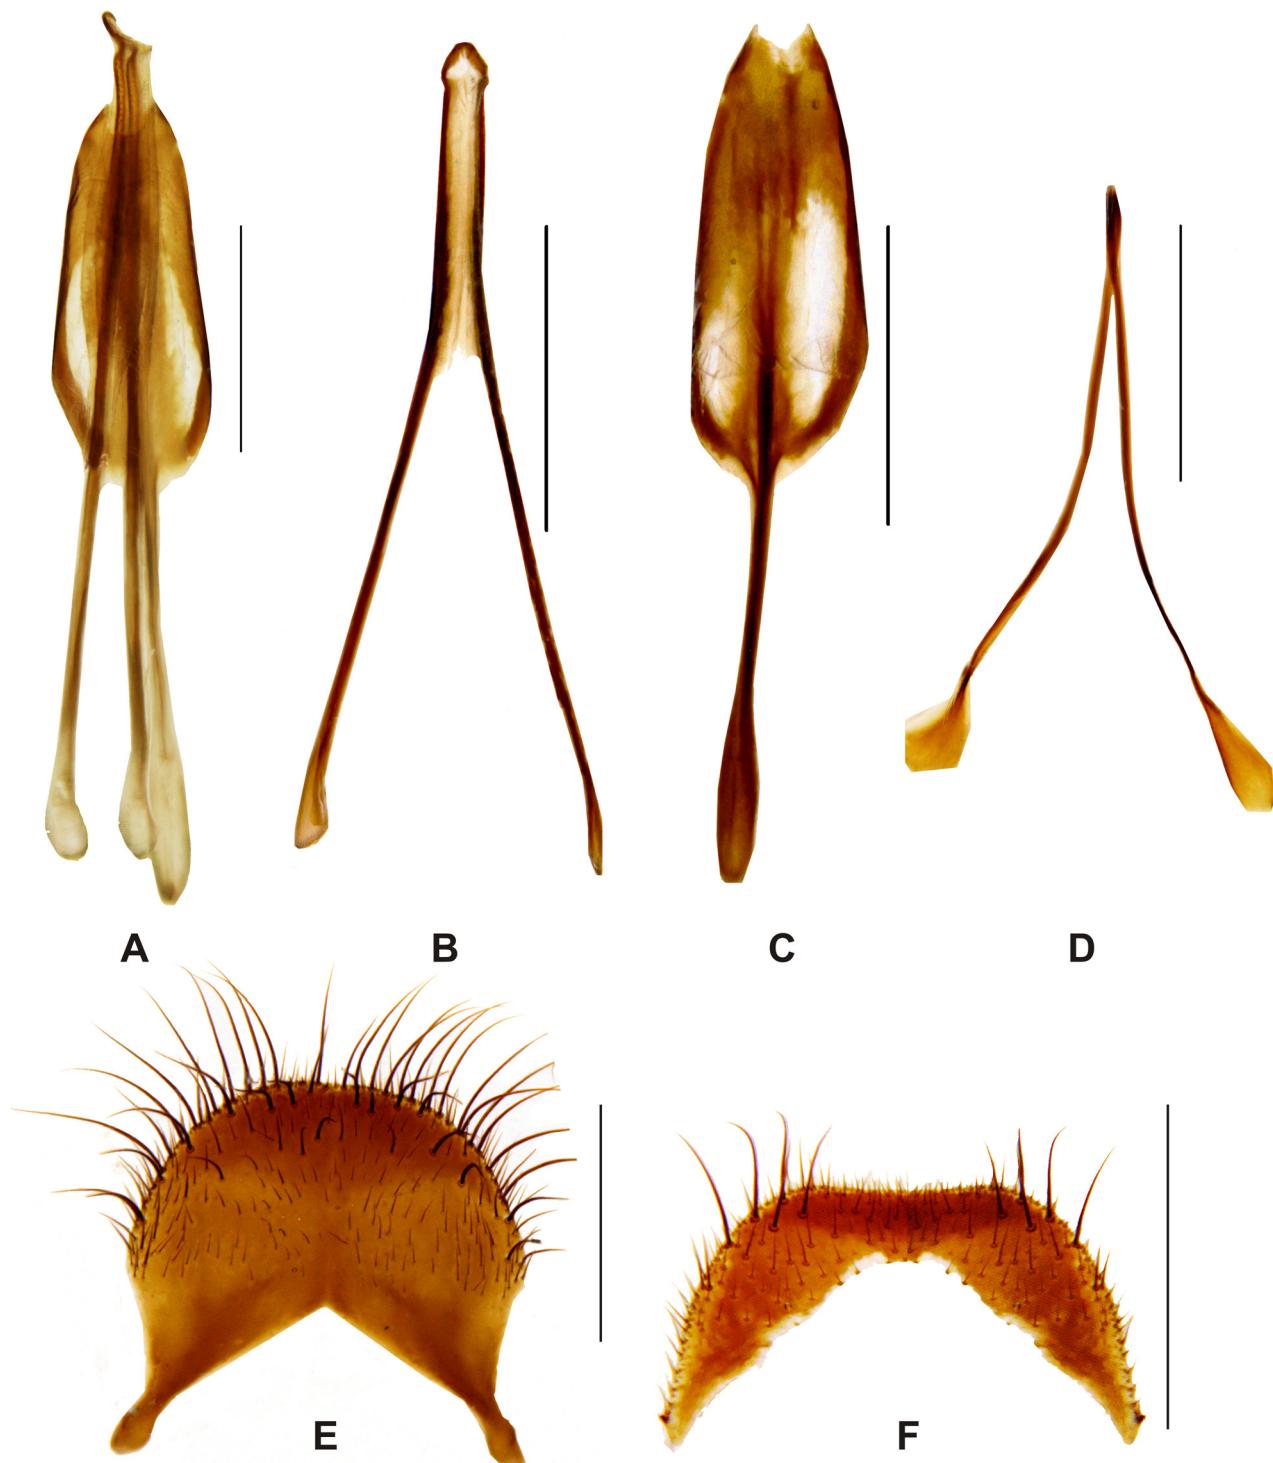

**Natalis alternicostata:** As Kuwert (1893) made no reference to specimens in his description it cannot be assumed that the nominal species-group name, *Natalis alternicostata*, was based on a single specimen. The 'type' specimen located in the Muséum National d'Histoire Naturelle, Paris (MNHN) must therefore be considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

**Natalis lata:** As Waterhouse (1894) made no reference to specimens in his description it cannot be assumed that the nominal species-group name, *Natalis lata*, was based on a single specimen. The 'type' specimen located in the Natural History Museum, London (BMNH) must therefore be considered a syntype (ICZN 1999: Article 73.2) and available for lectotype designation (ICZN 1999: Article 74.1).

**Diagnosis:** In combination, the narrow interocular space and the almost straight mesotibiae are the best characters for recognizing *E. semicostata*. The phallic tip is triangular and slightly emarginate; the spicular fork is only fused basally.

**FIGURE 45.** *Eunatalis semicostata*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrite VI.

**FIGURE 46.** Distribution of *Eunatalis semicostata*.

**Length:** (83 specimens measured) Total length: 16–25mm.

**Head:** Black, with isolated pilosity; with dense punctuation and fine wrinkles; eyes strongly convex; interocular space about one eye width (or slightly more).

**Thorax:** Pronotal length to width ratio 1.10:1; pronotum light brown to dark brown, with more or less distinct pilosity; pronotum with distinct punctuation, sides with conspicuously protruding wrinkles; grooves of sub-basal collar distinct, separated by a wide, flattened bar or almost fused. Scutellum dark brown, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.16:1; elytra light brown to dark brown, sometimes with a dark fascia in the middle; with isolated pilosity; elytral base slightly wider than pronotum, conspicuously broader behind middle, apex broadly rounded, lower lateral margin conspicuously protruding behind middle; diameter of punctations in basal half double as wide as interstices, first to fourth row of punctations abruptly decreasing behind middle, becoming extinct towards apex, fourth to eighth row of punctations only slightly decreasing behind middle; punctations of tenth stria distinct towards middle; punctations of ninth stria vestigial; elytral punctation with three nodules, basal nodule less distinct; interstices flattened in basal half, interstices 4, 6 and 8 conspicuously ridged shortly before middle, the others more or less flattened.

**Lower surface:** Light brown to dark brown, with dense pilosity, procoxal cavities opened posteriorly; mesoventrite weakly punctate, metaventrite slightly punctate and wrinkled, posterior part of mesepisternum impunctate; second and third abdominal ventrite with dense pilosity in the middle.

**Legs:** Dark brown, with isolated pilosity, fine punctuation; mesotibiae almost straight.

**Abdomen:** Tegmen ventrally and laterally broadly closed; phallic tip triangular and slightly emarginate; spicular fork fused only basally.

**Distribution:** Mainly coastal regions and inlands of East and South Australia, isolated localities in Northern Territory and Western Australia.

**Seasonal occurrence:** Collected from October to March.

**Remarks:** The type specimens of *E. alternicostata*, *E. lata* and *E. semicostata* did not show any differences in

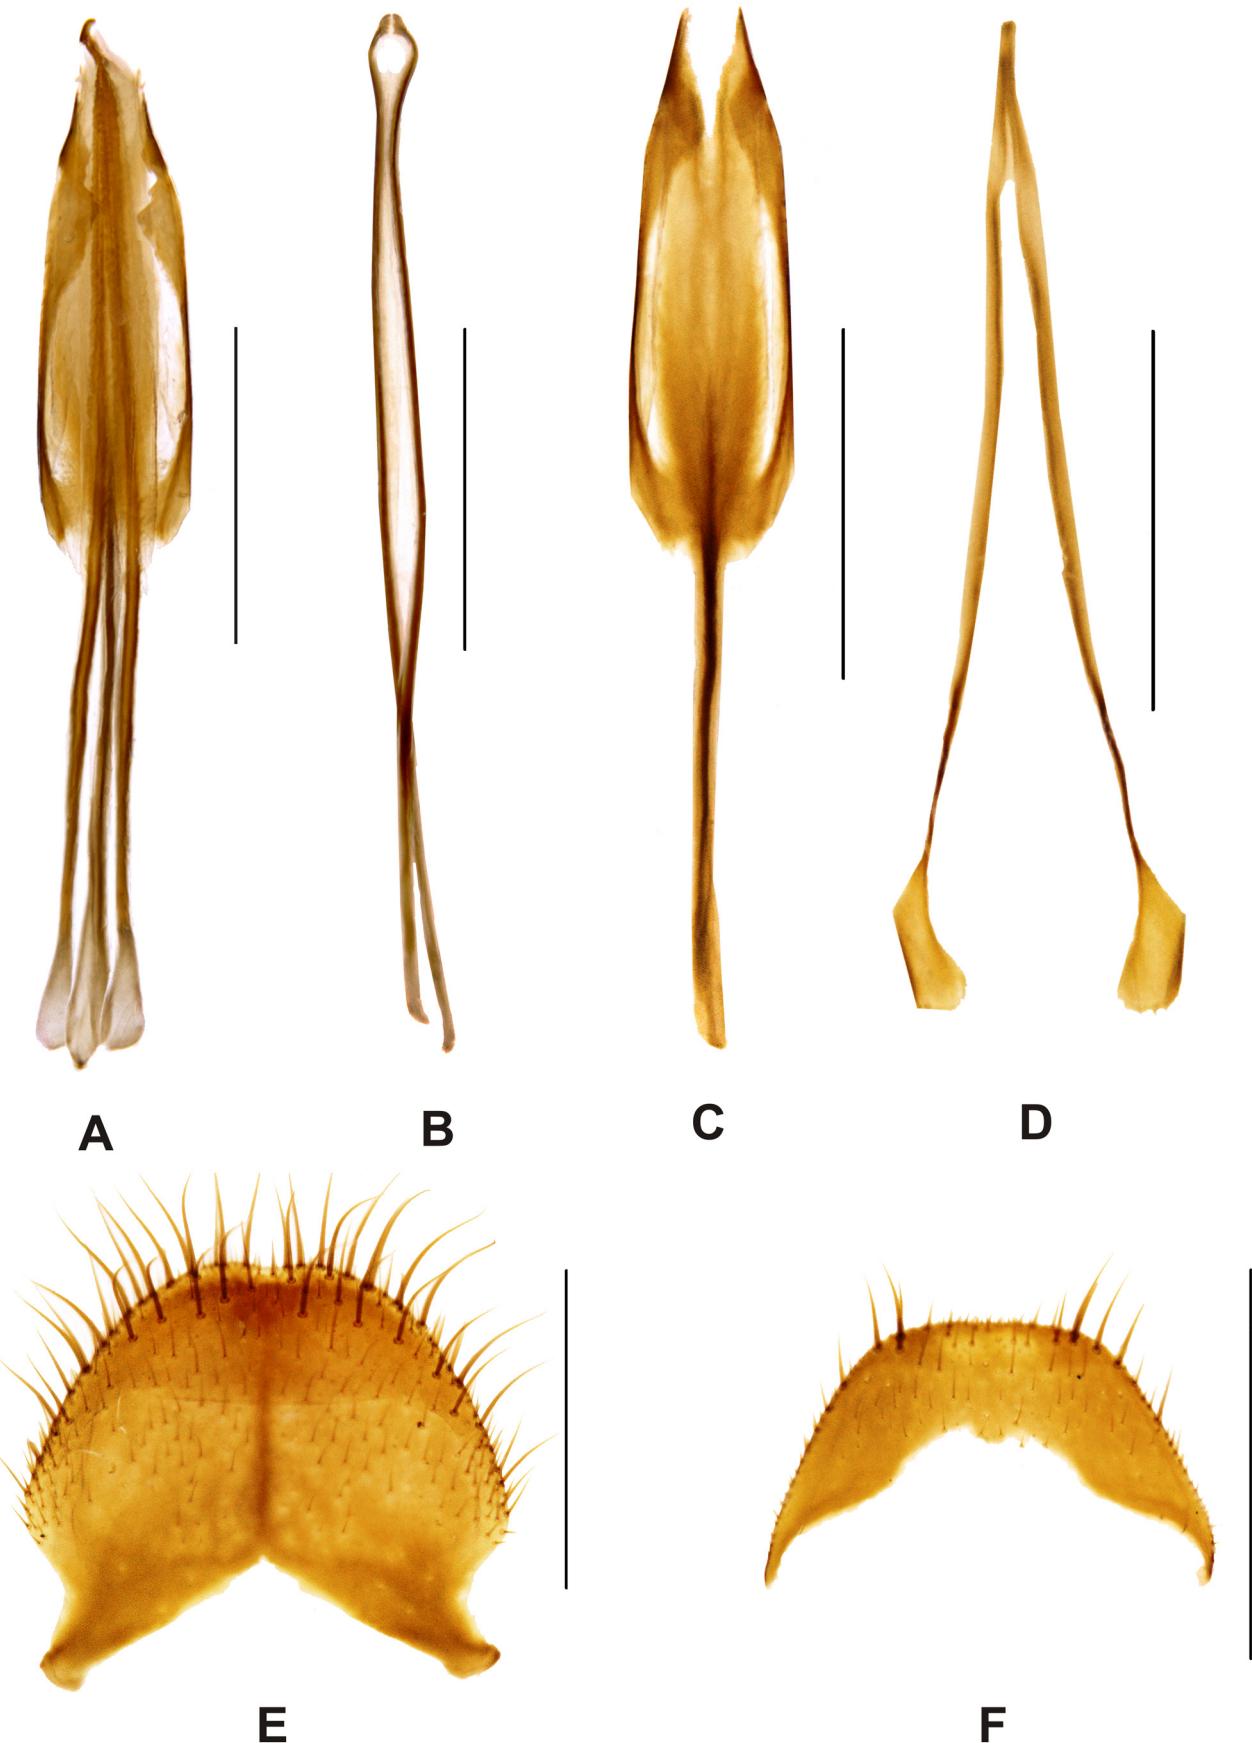

aedeagus, pygidium and sixth abdominal ventrite, therefore the species *E. alternicostata* and *E. lata* were synonymized with *E. semicostata*. The detailed descriptions of Blackburn (1889, 1890) for *E. semicostata* agree with our description above, except the typical shape of the first antennal segment.

**FIGURE 47.** *Eunatalis spadicea* n. sp.: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrite VI.

**FIGURE 48.** Distribution of *Eunatalis spadicea* n. sp.

2009, G.B. Monteith & F. Turco, malaise, 19192 (QM). Qld, Mornington Island, Mission, 6 June 1960, P. Aitken, N.B. Tindale; 25-035935 (SAMA). Daly R., N.T., H. Wesselman; Natalis hirta Blkb. (QM). 15.11S 143.52E (GPS), Hann River, Qld, 14 Jan 1994, at light, P. Zborowski, E.D. Edwards (ANIC). Silver Plains, Homestead, N.Q., at light, 29.X.64, J.L. Wessel (ANIC).

**Diagnosis:** It is not easy to separate *E. spadicea* n. sp. from *E. punctata*, but *E. spadicea* n. sp. has the elytra light brown to dark brown, with the apical half reddish-brown; *E. punctata* is much darker, almost black. Ventrite VI is almost straight, whereas in *E. punctata* it is emarginate. The phallic tip is more-or-less Z-shaped, with a conspicuous groove.

**Length:** (80 specimens measured) Total length: 13–20mm.

**Head:** Dark brown to black, more or less densely vested with fine, whitish-grey, depressed setae; with dense punctuation and fine wrinkles; epistomal suture not distinct; interocular space about one to 1.5 one eye width.

**Thorax:** Pronotal length to width ratio 1.08:1; pronotum black, more or less densely vested with fine, whitish-grey, depressed setae; pronotum slightly constricted towards apex; with weak punctuation, sides wrinkled; grooves of sub-basal collar distinct, separated by a bar. Scutellum dark brown to black, with isolated pilosity and light punctuation.

**Elytra:** Elytral length to width ratio 2.64:1; elytra light brown to dark brown, apical half reddish-brown, with isolated white pilosity; elytral base slightly broader than pronotum or equal, subparallel to slightly broader towards apex; diameter of punctations in basal half as wide as interstices, decreasing conspicuously behind middle; punctations of tenth stria distinct to shortly behind middle; punctations of ninth stria vestigial, sometimes with fine punctuation near apex; elytral punctuation with three weak nodules; interstices 4 and 6 slightly ridged behind the middle, without microsculpture.

**Lower surface:** Light brown to dark brown, with isolated white pilosity; procoxal cavities opened to closed posteriorly.

**Legs:** Dark brown, with dense, white pilosity, fine punctuation and wrinkles; mesotibiae bent.

**Abdomen:** Tegmen ventrally and laterally open; phallic tip with groove; spicular fork fused only basally.

**Distribution:** In the south of West and South Australia, south-east Queensland and Biak (Irian Jaya).

**Seasonal occurrence:** Collected from October to January.

**Etymology:** The specific epithet, *spadicea*, a Latin adjective refers to the reddish-brown apical half of the elytra.

### ***Eunatalis spinicornis* (Blackburn, 1890)**

(Figures 49–50, 58B)

*Natalis spinicornis* Blackburn, 1890: 123; Blackburn 1899: 29.

**Specimens examined:** **Lectotype** (designated here): Australia., Blackburn Coll., B.M. 1910-236, *Natalis spinicornis* Blackb.; Type (BMNH). **Paralectotype** (designated here): Adelaide, Blackburn; *Natalis spinicornis* co-type; *Natalis spinicornis* Bl. S. Australia, Cotype; No. 25-035814 (SAMA).

**Comment on the type specimens:** Although the BMNH specimen is marked with Blackburn's distinctive "T" (indicating the holotype) it must be, along with the SAMA specimen, considered a syntype because Blackburn (1890: 123) failed to designate type status to either specimen within his published description. Both specimens are available for lectotype designation (ICZN 1999: Article 74.1).

**Diagnosis:** *E. spinicornis* differs from all other species by the dentate elytral apices and a distinct longitudinal groove on the mesoventrite.

**Length:** (186 specimens measured) Total length: 20-31mm.

**Head:** Dark brown, with more or less short setae; with dense punctation and fine wrinkles; epistomal suture distinct; eyes very large and flattened; interocular space about one eye width; A11 acuminate.

**FIGURE 49.** *Eunatalis spinicornis*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventricle VI.

**Thorax:** Pronotal length to width ratio 1.09:1; pronotum light brown to dark brown, with isolated pilosity; with weak punctuation, sides wrinkled, dorsally partly with transverse wrinkles; grooves of sub-basal collar distinct, separated by a wide bar. Scutellum light brown to dark brown, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.71:1; elytra light brown to dark brown, basal half darker than apical half, with a light transverse fascia in the middle, with isolated pilosity; elytral base broader than pronotum, broader behind the middle, apex dentate; diameter of punctations in basal half double as wide as interstices, decreasing behind middle; punctations of tenth stria distinct up to shortly behind middle; punctations of ninth stria vestigial; elytral punctuation with three nodules; interstices 4 and 6 conspicuously ridged behind the middle.

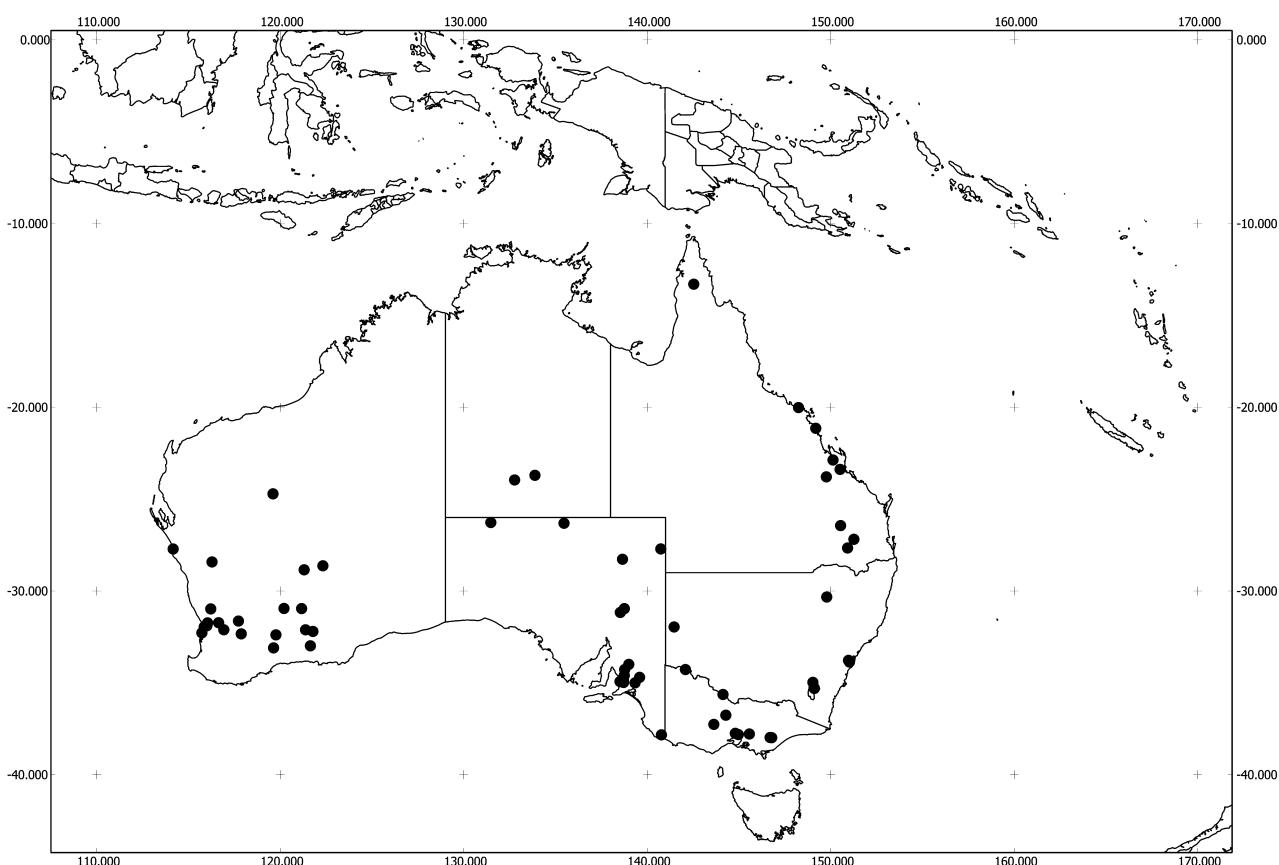

**Lower surface:** Light brown to dark brown, with dense pilosity and weak punctuation; procoxal cavities opened posteriorly; metaventrite with an oblique row of weak wrinkles; mesoventrite with a distinct longitudinal groove; abdominal ventrites laterally with a light or yellowish impression.

**Legs:** Dark brown, with isolated pilosity, weak punctuation and weak wrinkles; pro- and mesotibiae slightly bent.

**Abdomen:** Tegmen ventrally closed; phallic tip with a weak hook-like structure; spicular fork fused less than one-fifth.

**Distribution:** Mainly in the southern parts of Australia.

**Seasonal occurrence:** Collected throughout the year.

**FIGURE 50.** Distribution of *Eunatalis spinicornis*.

#### *Eunatalis titana* (Thomson, 1860)

(Figures 51–52, 58C)

*Natalis titana* Thomson, 1860: 56; Blackburn 1899: 29; Schenkling, 1903: t3, f3.

**Specimens examined: Holotype:** *Titana*, Thoms. Mus.Sci. II 60.56, Typus, Nov. Hollan.; ex Museo James Thomson; Type (MNHN).

**Comment on the type specimen:** In stating "Spec. unie. in mus. nostro", (i.e. one specimen in my collection) Thomson (1860: 56) indicated that the nominal species-group taxon, *Natalis titana*, was based a single specimen. The 'type' located in the Muséum National d'Histoire Naturelle, Paris (MNHN) is therefore considered the holotype, fixed by monotypy (ICZN 1999: Article 73.1.2).

Australien, Lina Rasim ded., 15.VII.1927, 2 ex. (SMNS).

**Diagnosis:** *E. titana* is a larger species. The pronotal disc is characterized by isolated fine punctuation, the pronotum is coarsely wrinkled laterally and the procoxal cavities are mostly open. The phallus is triangular, with a rounded tip.

**Length:** (94 specimens measured) Total length: 24-46mm.

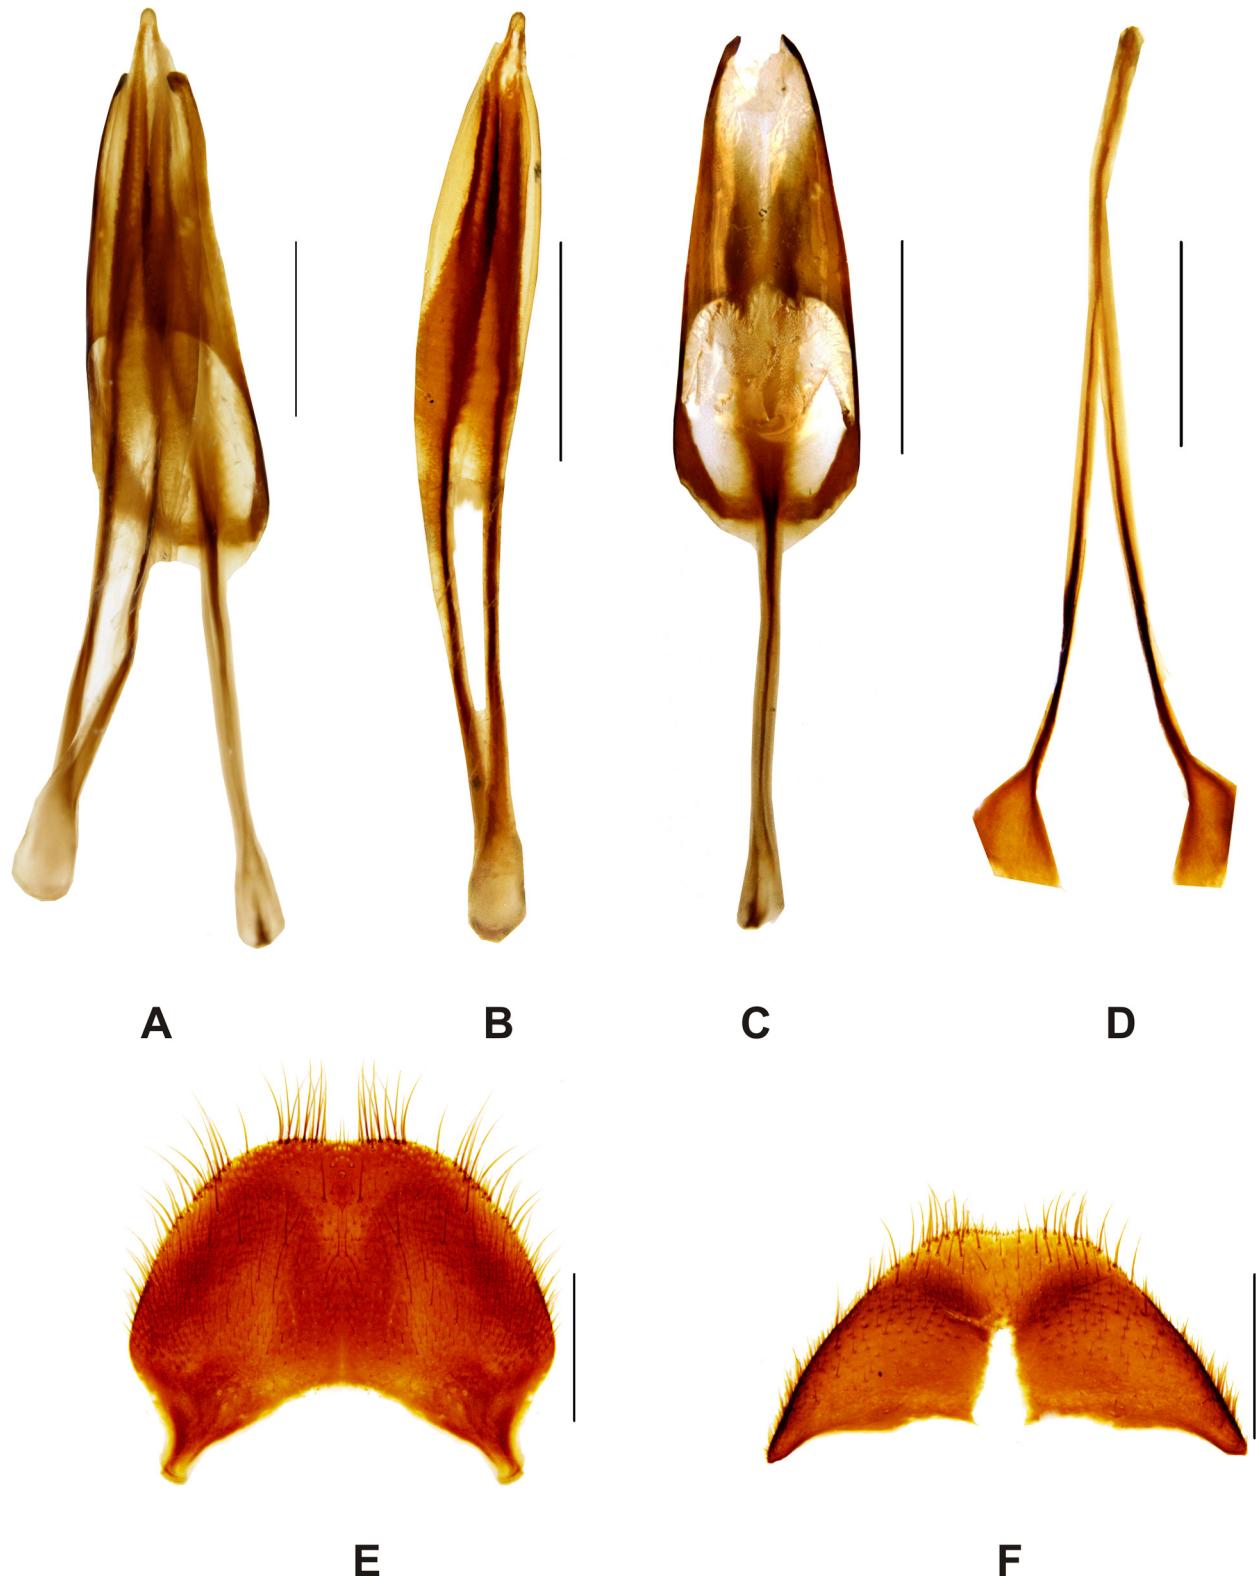

**Head:** Black, with isolated pilosity and weak punctuation, with fine wrinkles; epistomal suture distinct; interocular space about one eye width (or smaller).

**Thorax:** Pronotal length to width ratio 1.00:1; pronotum black, with isolated pilosity and weak punctuation, sides with strongly protruding wrinkles (some specimens also dorsally, behind the middle, strongly wrinkled); strongly convergent towards apex; longitudinal groove weak; grooves of sub-basal collar indistinct, fused. Scutellum dark brown to black, with weak punctuation.

**Elytra:** Elytral length to width ratio 2.53:1; elytra dark brown to black, basal half darker than apical half (one specimen with a light transverse fascia in the middle), with isolated pilosity; elytra subparallel to broader behind middle, apex partly conspicuously bevelled to slightly emarginate; elytral punctuation strongly oblong, in basal half

as wide as interstices, decreasing behind the middle, punctations of tenth stria conspicuous behind middle; punctations of ninth stria vestigial; elytral punctuation with two laterally conspicuously protruding nodules; interstices 2, 4 and 6 slightly ridged, the other interstices flattened, with distinct microsculpture.

**Lower surface:** Dark brown to black, with dense pilosity, mesoventrite with distinct transverse convexity; metaventrite with dense pilosity and wrinkles; posterior part of mesepisternum not depressed; procoxal cavities slightly opened posteriorly.

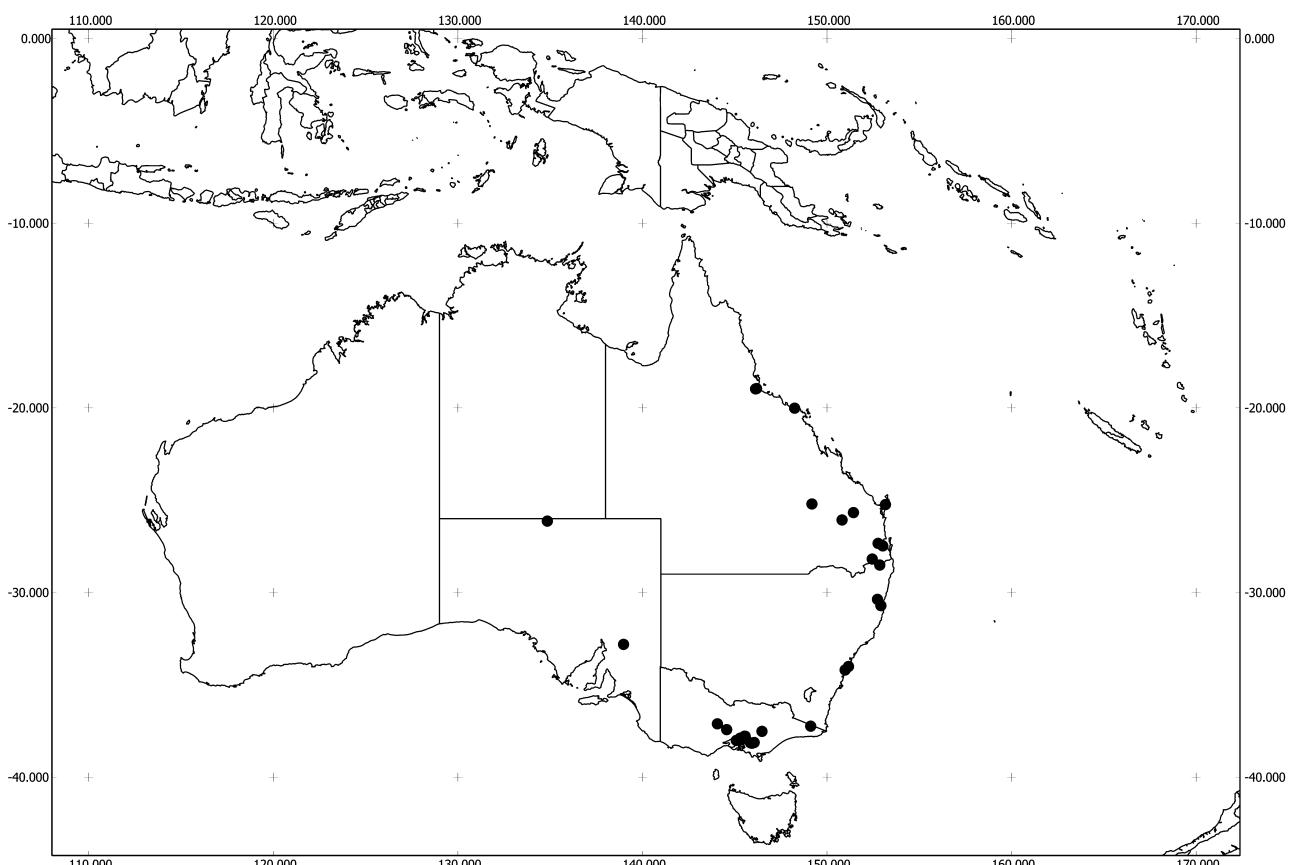

**FIGURE 51.** *Eunatalis titana*: (A) Phallus lateral, (B) Phallus ventral, (C) Tegmen ventral, (D) Spicular fork, (E) Pygidium, (F) Ventrite VI.

**Legs:** Black, especially tibiae and inner edges of femora with dense pilosity, with dense punctuation and wrinkles; mesotibiae bent.

**Abdomen:** Aedeagus, spicular fork, pygidium and sixth ventrite relatively large and deeply emarginate triangularly; tegmen ventrally closed, dorsally only base closed; phallus triangular with rounded tip; spicular fork fused to one-third.

**Distribution:** Mainly in eastern part of Australia and South Australia.

**Seasonal occurrence:** Collected from November to April.

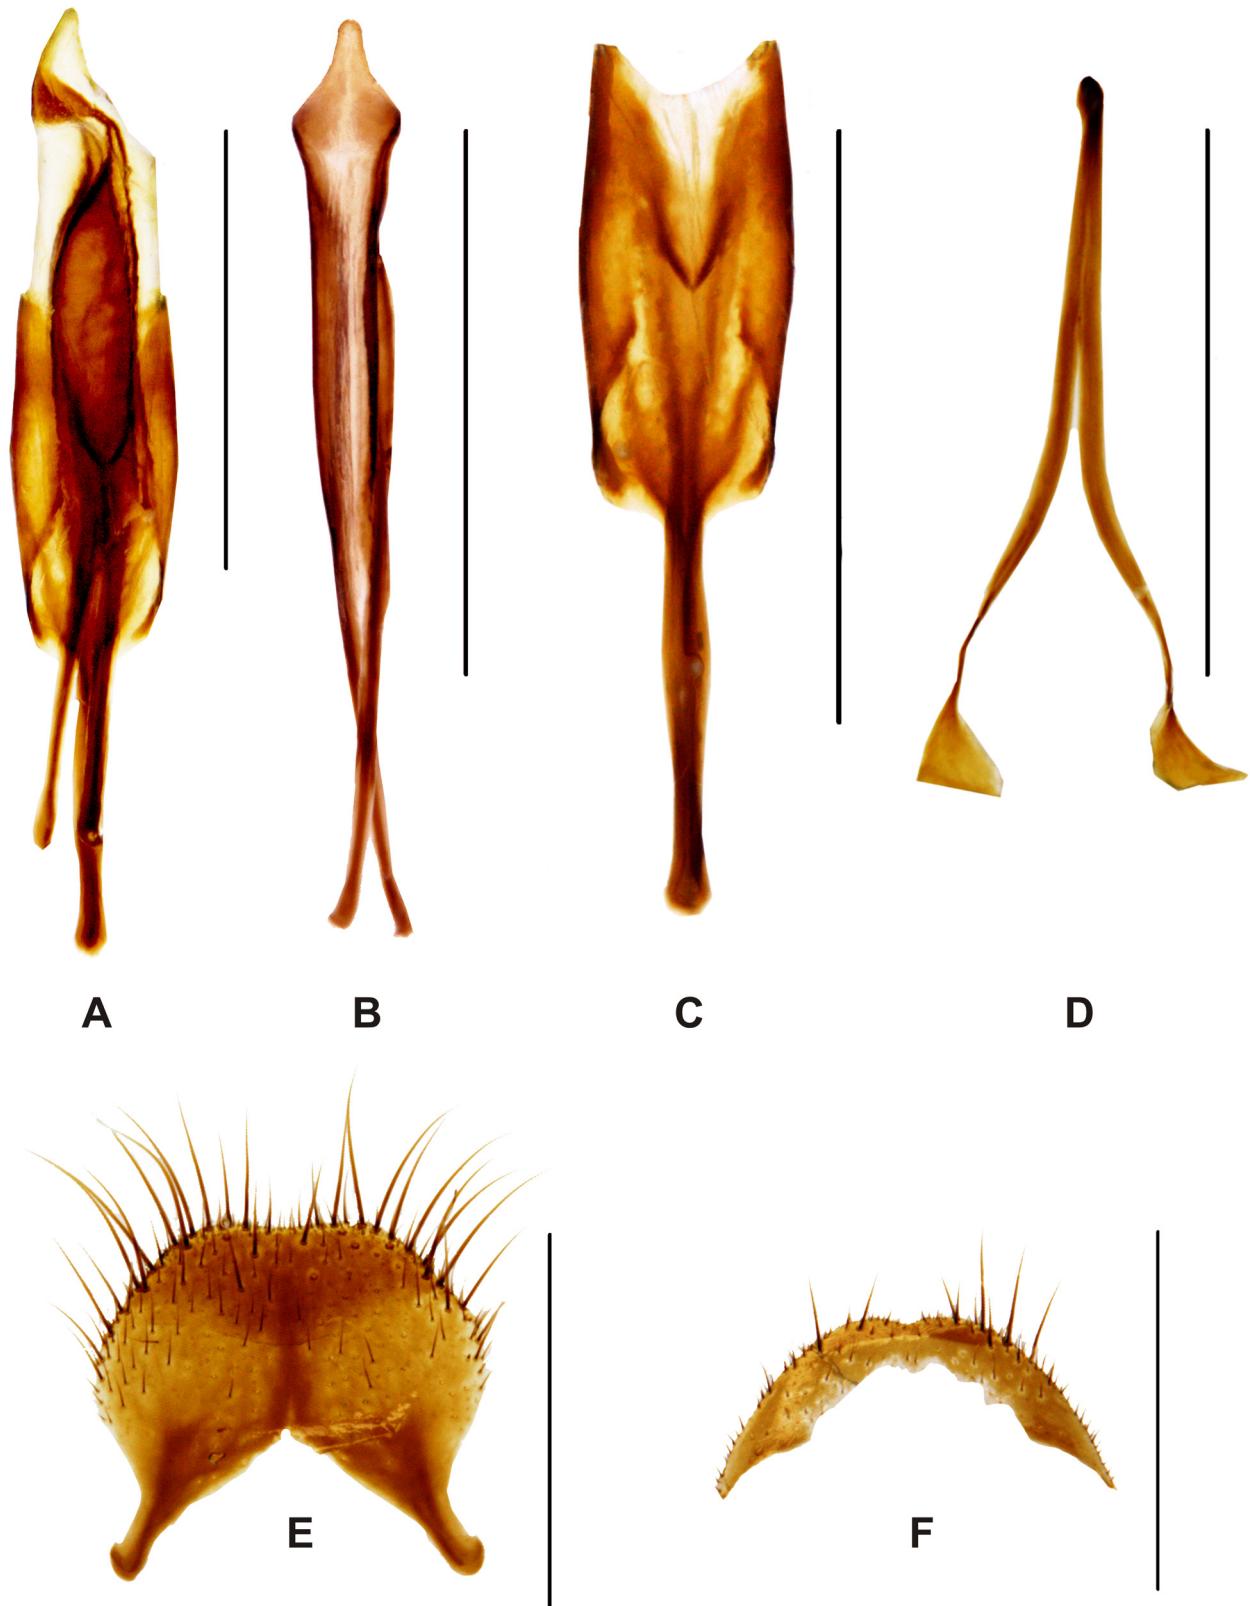

**FIGURE 52.** Distribution of *Eunatalis titana*.

Australia occid., 1192; *Eunatalis* ?*integra* Blkb., det. Corporaal 1938

(HNHM). Australia, Qld., Mt. Surprise, 3/1993, Lamond (RGCM). Australien, WA, 33, 26 km e Napier Downs, 175 km Derby, 23.–24.11.1984, M.+B. Baehr (RGCM).

**Diagnosis:** *E. villosa n. sp.* is distinguished by the wide interocular space, in combination with subparallel elytra (in contrast to the dilated elytra of *E. hirta*) and the diameter of elytral punctation not decreasing towards apex. The ridged elytral interstices 2, 4, 6, and 8 are particular of *E. hirta*. Although the aedeagi of *E. villosa n. sp.* and *E. hirta* are similar, the spicular fork of *E. villosa n. sp.* is fused to one-third its length (one-fifth in *E. hirta*).

**Length:** (63 specimens measured) Total length: 11–17 mm.

**Head:** Dark brown to black, with dense pilosity; with dense punctuation and fine wrinkles; epistomal suture distinct; interocular space about 1.5 to double eye width.

**Thorax:** Pronotal length to width ratio 1.13:1; pronotum dark brown to black, with dense pilosity; pronotum parallel towards apex; with dense, large and small punctuation, sides inconspicuously wrinkled or without wrinkles; grooves of sub-basal collar less distinct, separated by a wide bar or fused. Scutellum dark brown to black, with dense punctuation and pilosity.

**Elytra:** Elytral length to width ratio 2.36:1; elytra dark brown to black, with dense pilosity; elytral base slightly broader than pronotum, sub-parallel towards apex; elytral punctuation in basal half as wide as interstices, not decreasing towards apex; elytral punctuation with three nodules; punctations of tenth stria distinct almost towards apex; punctations of ninth stria vestigial; interstices 4 and 6 slightly ridged behind the middle, all other interstices flattened, with distinct microsculpture.

**Lower surface:** Dark brown to black, with dense pilosity; mesoventrite, metaventrite and abdominal ventrites with dense punctuation; procoxal cavities slightly opened to almost closed posteriorly.

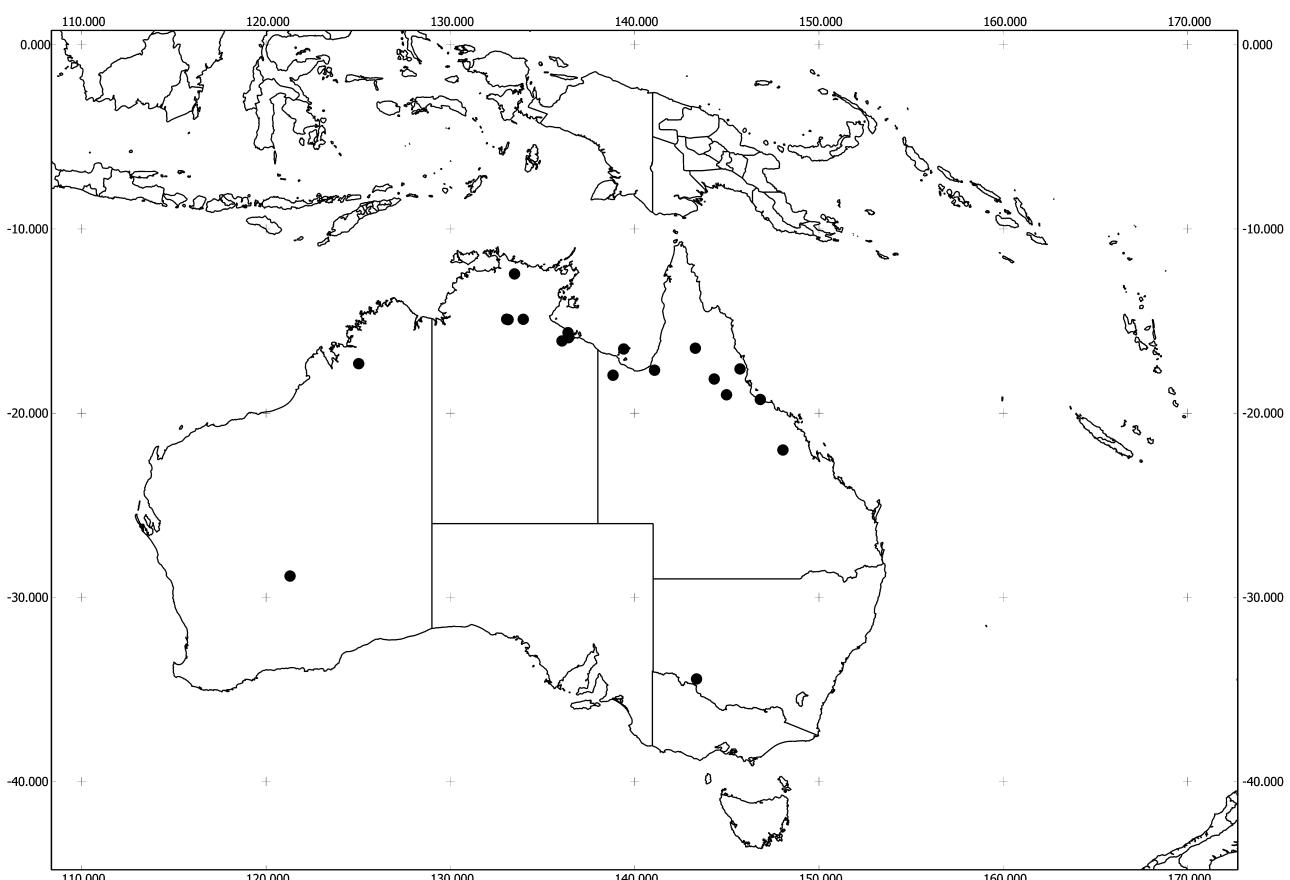

**Legs:** Dark brown to black, with dense pilosity, with dense punctuation and fine wrinkles; mesotibiae bent.

**Abdomen:** Tegmen ventrally closed; phallic tip Z-shaped; spicular fork fused to one-third.

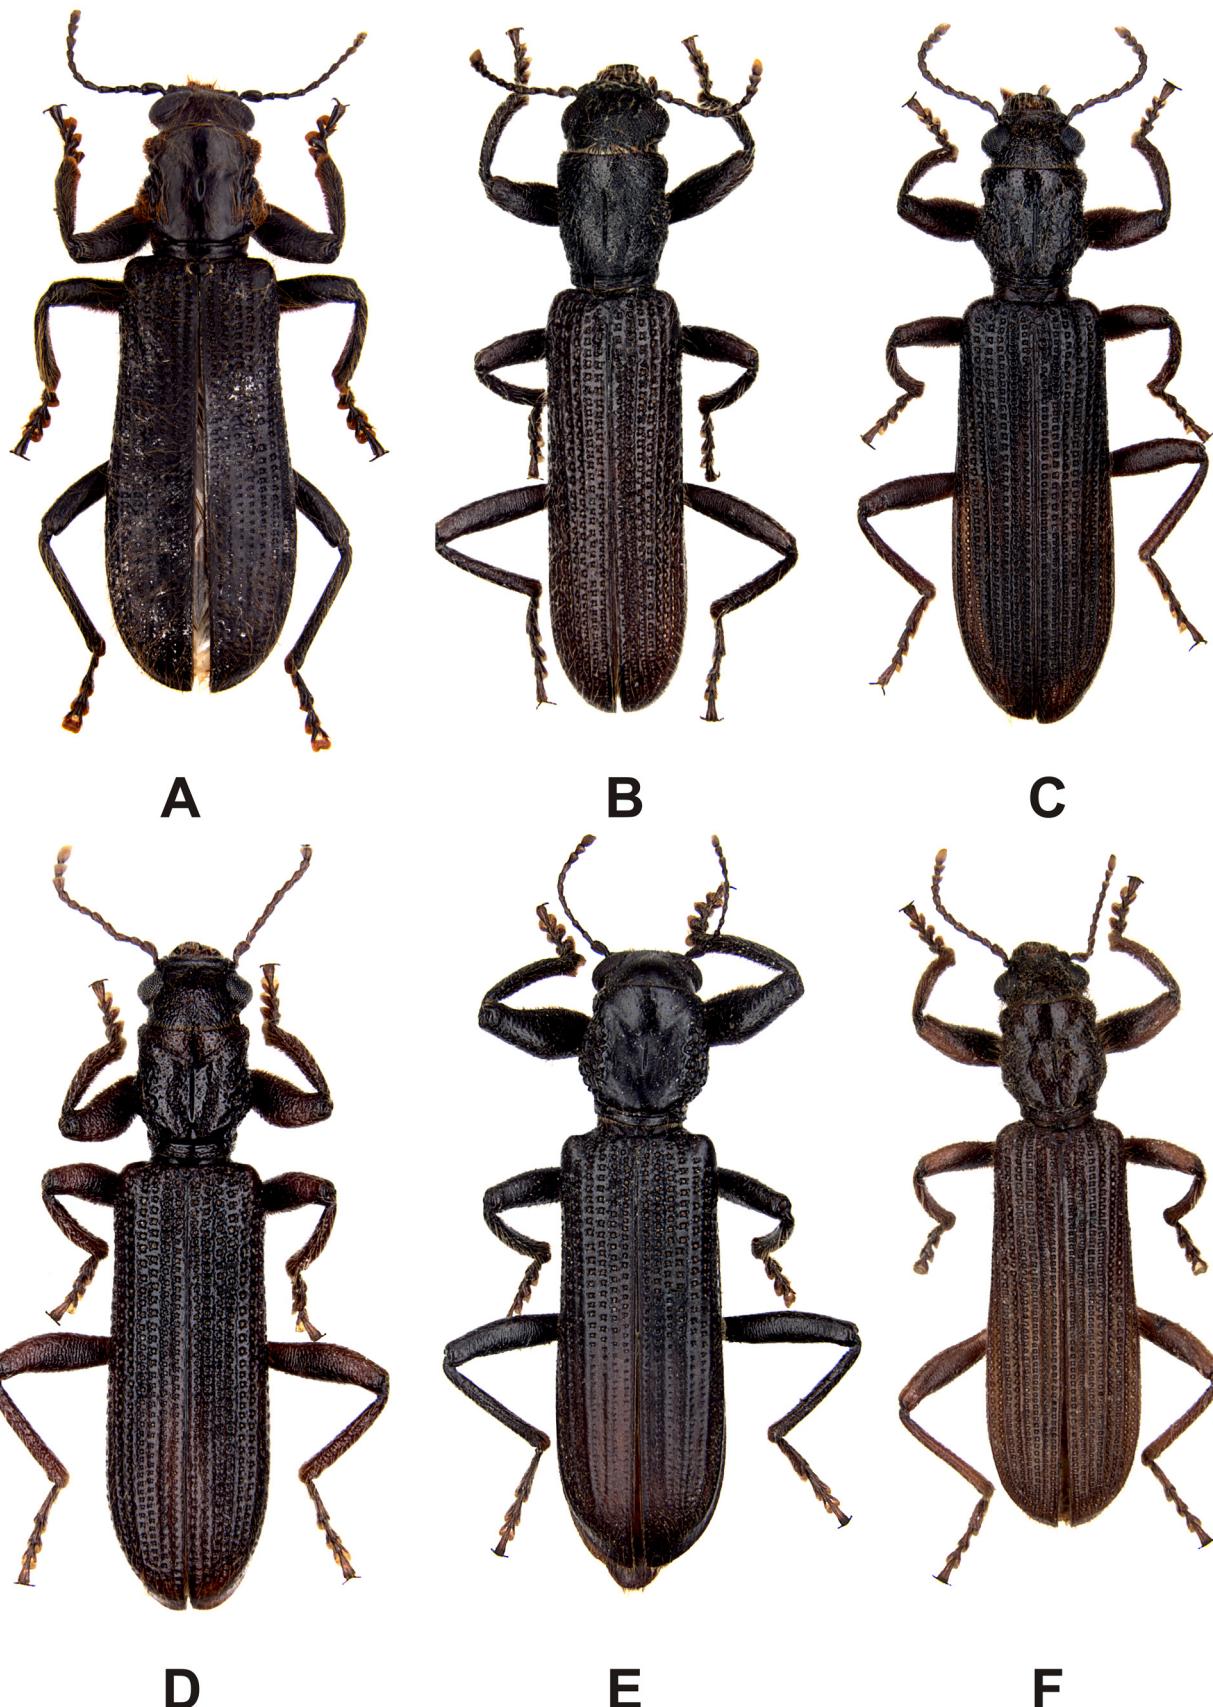

**Distribution:** Mainly in northern parts of Australia and some localities in the south.

**Seasonal occurrence:** Collected from November to March.

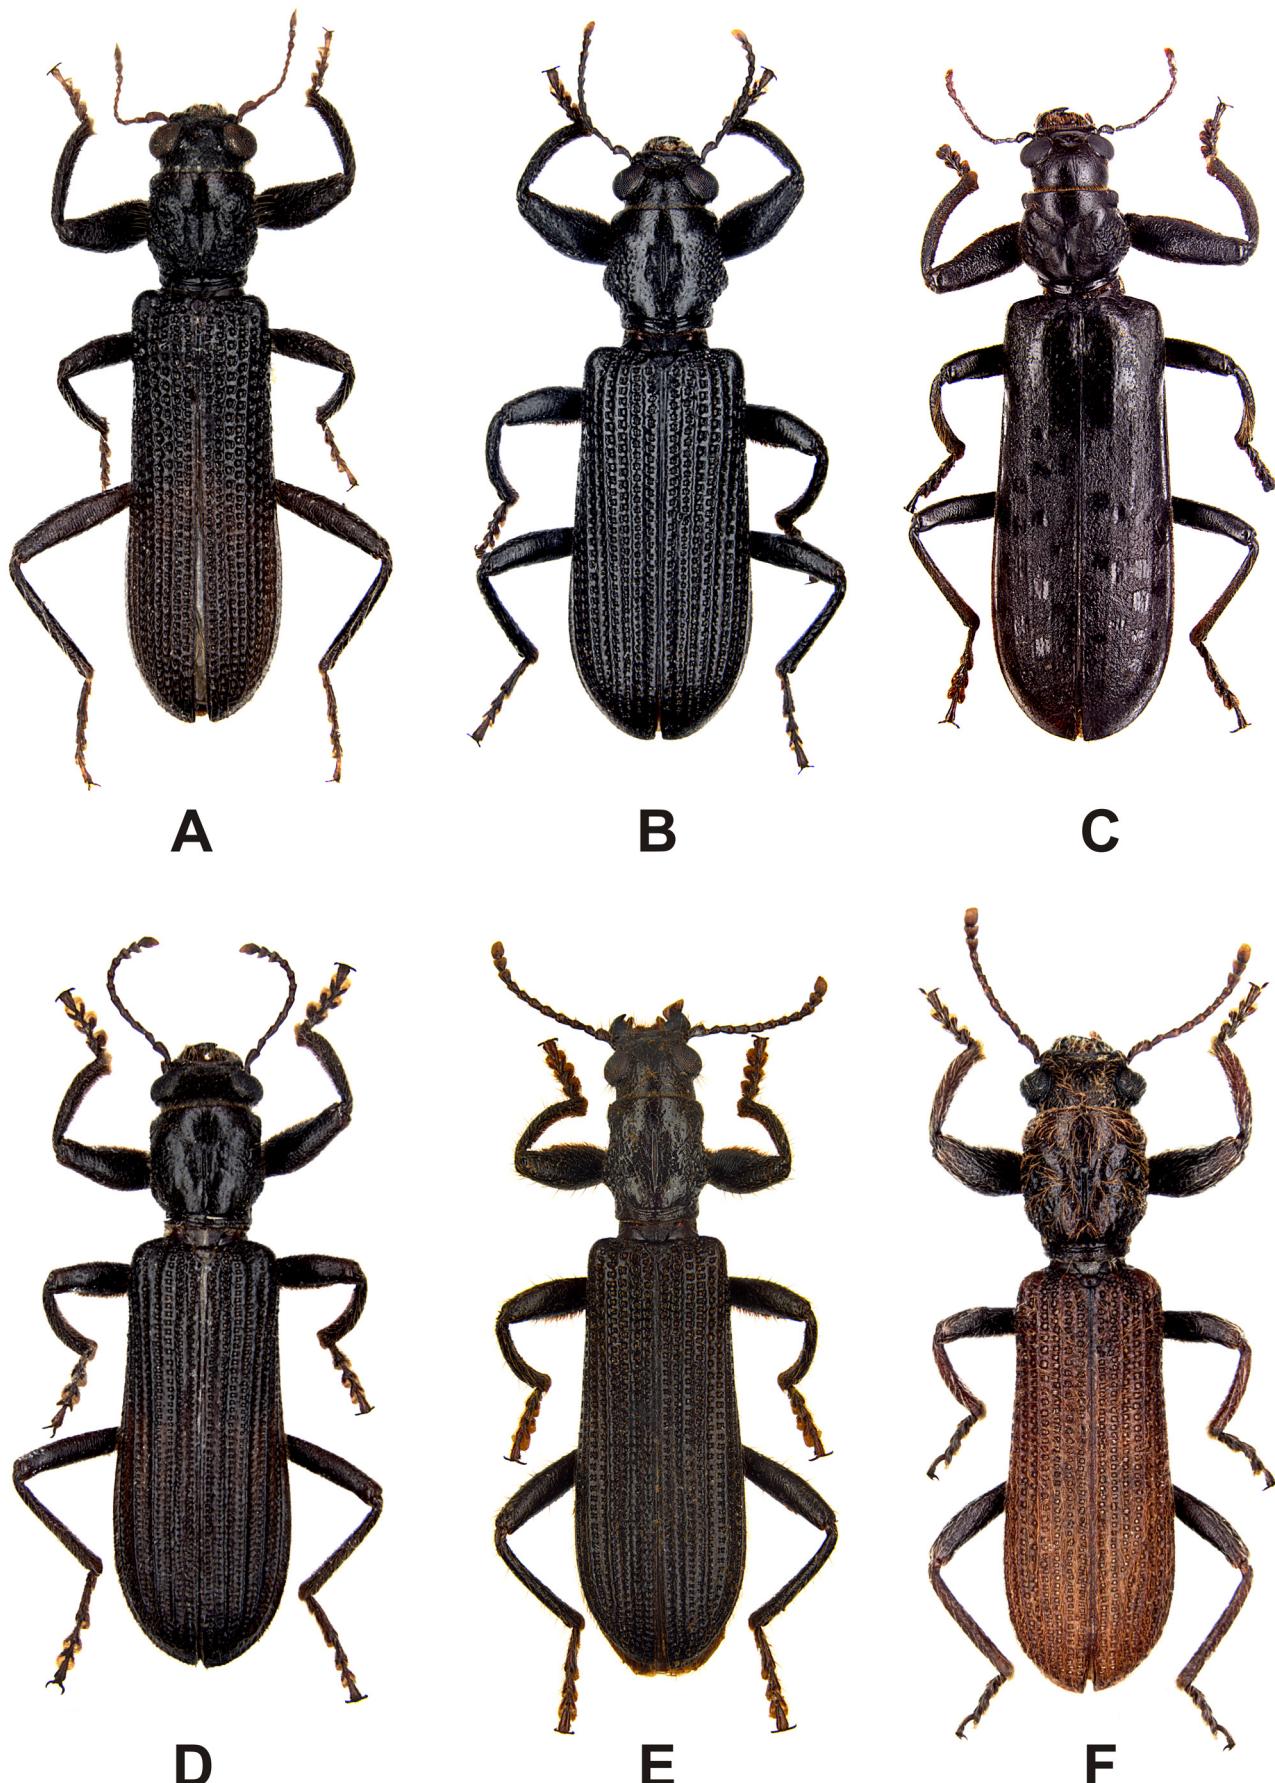

**Etymology:** The specific epithet, *villosa*, a Latin adjective refers to the dense pilosity.

**FIGURE 54.** Distribution of *Eunatalis villosa n. sp.*
